## Index 35

## 1 Principles

This Monte Carlo generator, based on the LPAIR code developed in the early 1990s by J. Vermaseren *et al*[3], allows to compute the cross-section and to generate events for the  $\gamma\gamma \rightarrow \ell^+\ell^-$  process in high energy physics.

The main operation is the integration of the matrix element (given as a [GamGam](#) object, subset of a [Process](#) object) performed by [Vegas](#), an importance sampling algorithm written in 1972 by G. P. Lepage[2].

## 2 Todo List

### Global [GamGam::ComputeWeight](#) (int nm\_=1)

Find out what this *nm\_* parameter does...

### Global [GamGam::GamGam](#) (const unsigned int ndim\_, int nOpt\_, double x\_[])

Figure out how this *nOpt\_* parameter is affecting the final cross-section computation and events generation

## 3 Deprecated List

### Global [MCGen::LaunchGeneration](#) ()

This method is to be suppressed since the events generation can now be launched one event at a time using the *GenerateOneEvent* method

## 4 Hierarchical Index

### 4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

<b>Event</b>	<b>3</b>
<b>GamGamKinematics</b>	<b>11</b>

<b>Hadroniser</b>	<b>13</b>
<b>Jetset7Hadroniser</b>	<b>14</b>
<b>Pythia6Hadroniser</b>	<b>31</b>
<b>MCGen</b>	<b>16</b>
<b>Parameters</b>	<b>17</b>
<b>Particle</b>	<b>22</b>
<b>Process</b>	<b>30</b>
<b>GamGam</b>	<b>7</b>
<b>Vegas</b>	<b>32</b>

## 5 Data Structure Index

### 5.1 Data Structures

Here are the data structures with brief descriptions:

<b>Event</b>

## 6 Data Structure Documentation

## 6.1 Event Class Reference

Kinematic information on the particles in the event.

### Public Member Functions

- `int AddParticle (Particle *part_, bool replace_=false)`  
*Add a particle to the event.*
- `void Dump (bool stable_=false)`
- `Particle * GetById (int id_)`  
*Gets one particle by its unique identifier in the event.*
- `Particles GetByIds (std::vector< int > ids_)`  
*Gets a vector of particles by their unique identifier in the event.*
- `Particles GetByRole (int role_)`  
*Copies all the relevant quantities from one Event object to another.*
- `Particles GetDaughters (Particle *part_)`  
*Gets a vector containing all the daughters from a particle.*
- `std::string GetLHERecord (const double weight_=1.)`  
*Gets the LHE block for this event.*
- `Particle * GetMother (Particle *part_)`
- `Particle * GetOneByRole (int role_)`
- `Particles GetParticles ()`  
*Gets a vector of particles in the event.*
- `std::vector< int > GetRoles ()`
- `Particles GetStableParticles ()`  
*Gets a vector of stable particles in the event.*
- `int NumParticles ()`  
*Number of particles in the event.*
- `void Store (std::ofstream *, double weight_=1.)`

#### 6.1.1 Detailed Description

Class containing all the information on the in- and outgoing particles' kinematics

#### 6.1.2 Member Function Documentation

##### 6.1.2.1 `int Event::AddParticle ( Particle * part_, bool replace_ = false )`

Sets the information on one particle in the process

Parameters

<code>in</code>	<code>part_</code>	The <code>Particle</code> object to insert or modify in the event
<code>in</code>	<code>replace_</code>	Do we replace the particle if already present in the event or do we append another particle with the same role ?

Returns

- 1 if a new `Particle` object has been inserted in the event
- 0 if an existing `Particle` object has been modified
- -1 if the requested role to edit is undefined or incorrect

##### 6.1.2.2 `void Event::Dump ( bool stable_ = false )`

Dumps all the known information on every `Particle` object contained in this `Event` container in the output stream

## Parameters

<b>in</b>	<i>stable_</i>	Do we only show the stable particles in this event ?
-----------	----------------	--

6.1.2.3 **Particle\*** Event::GetById ( int id\_ )

Returns the pointer to the [Particle](#) object corresponding to a unique identifier in the event

## Parameters

<b>in</b>	<i>id_</i>	The unique identifier to this particle in the event
-----------	------------	---

## Returns

A pointer to the requested [Particle](#) object

## 6.1.2.4 Particles Event::GetByIds ( std::vector&lt; int &gt; ids\_ ) [inline]

Returns the pointers to the [Particle](#) objects corresponding to the unique identifiers in the event

## Parameters

<b>in</b>	<i>ids_</i>	The unique identifiers to the particles to be selected in the event
-----------	-------------	---

## Returns

A vector of pointers to the requested [Particle](#) objects

## 6.1.2.5 Particles Event::GetByRole ( int role\_ )

Returns the list of pointers to the [Particle](#) objects corresponding to a certain role in the process kinematics  
Gets a list of particles by their role in the event

## Parameters

<b>in</b>	<i>role_</i>	The role the particles have to play in the process
-----------	--------------	--

## Returns

A vector of pointers to the requested [Particle](#) objects

6.1.2.6 Particles Event::GetDaughters ( **Particle** \* part\_ ) [inline]

## Parameters

<b>in</b>	<i>part_</i>	The particle for which the daughter particles have to be retrieved
-----------	--------------	--

Returns

A [Particle](#) objects vector containing all the daughters' kinematic information

Here is the call graph for this function:

6.1.2.7 `std::string Event::GetLHERecord ( const double weight_ = 1. )`

Returns an event block in a LHE format (a XML-style) with all the information on the particles composing this event

Parameters

<code>in</code>	<code>weight_</code>	The weight of the event
-----------------	----------------------	-------------------------

Returns

A string containing the kinematic quantities for each of the particles in the event, formatted as the LHE standard requires.

6.1.2.8 `Particle* Event::GetMother ( Particle * part_ ) [inline]`

Returns the pointer to the mother particle of any given [Particle](#) object in this event

Parameters

<code>in</code>	<code>part_</code>	The pointer to the <a href="#">Particle</a> object from which we want to extract the mother particle
-----------------	--------------------	--

Returns

A pointer to the mother [Particle](#) object

Here is the call graph for this function:

#### 6.1.2.9 **Particle\*** Event::GetOneByRole ( int role\_ ) [inline]

Returns the first [Particle](#) object in the particles list whose role corresponds to the given argument

Parameters

<b>in</b>	<i>role_</i>	The role the particle has to play in the event
-----------	--------------	--

Returns

A [Particle](#) object corresponding to the first particle found in this event

Here is the call graph for this function:

#### 6.1.2.10 **Particles** Event::GetParticles ( )

Returns

A vector containing all the pointers to the [Particle](#) objects contained in the event

#### 6.1.2.11 **std::vector<int>** Event::GetRoles ( )

Gets a list of roles for the given event (really process-dependant for the central system)

Returns

A vector of integers corresponding to all the roles the particles can play in the event

#### 6.1.2.12 **Particles** Event::GetStableParticles ( )

Returns

A vector containing all the pointers to the stable [Particle](#) objects contained in the event

#### 6.1.2.13 **int** Event::NumParticles ( ) [inline]

Returns

The number of particles in the event, as an integer

#### 6.1.2.14 **void** Event::Store ( std::ofstream \*, double weight\_ = 1. )

Stores in a file (raw format) all the kinematics on the outgoing leptons

## Parameters

<code>in</code>	<code>weight_</code>	The weight of the event
-----------------	----------------------	-------------------------

## 6.2 GamGam Class Reference

Computes the matrix element for a  $\gamma\gamma \rightarrow \ell^+\ell^-$  process.

Inheritance diagram for GamGam:

Collaboration diagram for GamGam:

## Public Member Functions

- `GamGam` (const unsigned int ndim\_, int nOpt\_, double x\_<sub>[]</sub>)  
*Class constructor.*
- void `ComputeCMenergy` ()  
*Computes  $\sqrt{s}$  for the system.*
- double `ComputeMX` (double x\_, double outmass\_, double \*dw\_)  
*Computes the outgoing proton remnant mass.*
- double `ComputeWeight` ()  
*Returns the weight for this point in the phase-space.*
- double `ComputeWeight` (int nm\_=1)  
*Computes the process' weight for the given point.*
- void `FillKinematics` (bool symmetrise\_=false)

- Fills the [Event](#) object with the particles' kinematics.*
- double **GetD3** ()
- [Event](#) \* [GetEvent](#) ()
  - Returns the event content (list of particles with an assigned role)*
- double **GetS1** ()

- double **GetU1** ()
- double **GetU2** ()
- double **GetV1** ()
- double **GetV2** ()
- bool [IsKinematicsDefined](#) ()
  - Is the system's kinematics well defined?*
- void [PrepareHadronisation](#) ([Particle](#) \*part\_)
- bool [SetIncomingKinematics](#) ([Particle](#) ip1\_, [Particle](#) ip2\_)
  - Sets the momentum and PDG id for the incoming particles.*
- void [SetKinematics](#) ([GamGamKinematics](#) cuts\_)
  - Sets the list of kinematic cuts to apply on the outgoing particles' final state.*
- bool [SetOutgoingParticles](#) (int part\_, int pdgId\_)
  - Sets the PDG id for the outgoing particles.*
- void **StoreEvent** (std::ofstream \*, double)

### 6.2.1 Detailed Description

Full class of methods and objects to compute the full analytic matrix element [3] for the  $\gamma\gamma \rightarrow \ell^+\ell^-$  process according to a set of kinematic constraints provided for the incoming and outgoing particles (the [GamGamKinematics](#) object).

### 6.2.2 Constructor & Destructor Documentation

#### 6.2.2.1 [GamGam::GamGam](#) ( const unsigned int ndim\_, int nOpt\_, double x\_[] )

Sets the mandatory parameters used in the methods computing the kinematics and the cross-section of this phase space point.

Parameters

in	<i>ndim_</i>	The number of dimensions of the point in the phase space
in	<i>nOpt_</i>	Optimisation???
in	<i>x_[]</i>	The ( <i>ndim_</i> )-dimensional point in the phase space on which the kinematics and the cross-section are computed

**Todo** Figure out how this *nOpt\_* parameter is affecting the final cross-section computation and events generation

### 6.2.3 Member Function Documentation

#### 6.2.3.1 void [GamGam::ComputeCMenergy](#) ( )

Computes the centre of mass energy for the system, according to the incoming particles' kinematics

#### 6.2.3.2 double [GamGam::ComputeMX](#) ( double x\_, double outmass\_, double \* dw\_ )

Computes the mass of the outgoing proton remnant if any

## Parameters

in	$x_{-}$	A random number (between 0 and 1)
in	$outmass_{-}$	The maximal outgoing particles' invariant mass
out	$dw_{-}$	The size of the integration bin

## Returns

The mass of the outgoing proton remnant

## 6.2.3.3 double GamGam::ComputeWeight ( int nm\_ = 1 )

Computes the cross-section for the  $\gamma\gamma \rightarrow \ell^+\ell^-$  process with the given kinematics

## Parameters

in	$nm_{-}$	???
----	----------	-----

## Returns

$\frac{d\sigma}{dx}(\gamma\gamma \rightarrow \ell^+\ell^-)$ , the differential cross-section for the given point in the phase space.

**Todo** Find out what this  $nm_{-}$  parameter does...

## 6.2.3.4 void GamGam::FillKinematics ( bool symmetrise\_ = false )

Fills the private [Event](#) object with all the [Particle](#) object contained in this event. The particle roles in this process are defined as following :

Figure 1: Detailed particle roles in the two-photon process as defined by the *GamGam* object. The incoming protons/electrons are denoted by a role 1, and 2, as the outgoing protons/protons remnants/electrons carry the indices 3 and 5. The two outgoing leptons have the roles 6 and 7, while the lepton/antilepton distinction is done randomly (thus, the arrow convention is irrelevant here).

## Parameters

in	$symmetrise_{-}$	Do we have to symmetrise the event (randomise the production of the positively- and negatively-charged lepton) ?
----	------------------	--

6.2.3.5 **Event\*** GamGam::GetEvent ( ) [inline]

Returns the complete list of [Particle](#) with their role in the process for the point considered in the phase space as an [Event](#) object.

## Returns

The [Event](#) object containing all the generated [Particle](#) objects

6.2.3.6 double GamGam::GetT1 ( ) [inline]

Returns the value for the first photon virtuality

Returns

$t_1$ , the first photon virtuality

6.2.3.7 void GamGam::GetT1extrema ( double & t1min\_, double & t1max\_ ) [inline]

Returns the two limit values for the first photon virtuality

Parameters

out	<i>t1min_</i>	The minimal value for $t_1$
out	<i>t1max_</i>	The maximal value for $t_1$

6.2.3.8 double GamGam::GetT2 ( ) [inline]

Returns the value for the second photon virtuality

Returns

$t_2$ , the second photon virtuality

6.2.3.9 void GamGam::GetT2extrema ( double & t2min\_, double & t2max\_ ) [inline]

Returns the two limit values for the second photon virtuality

Parameters

out	<i>t2min_</i>	The minimal value for $t_2$
out	<i>t2max_</i>	The maximal value for $t_2$

6.2.3.10 bool GamGam::IsKinematicsDefined ( ) [inline]

Is the system's kinematics well defined and compatible with the process ? This check is mandatory to perform the (*\_ndim*)-dimensional point's cross-section computation.

Returns

A boolean stating if the input kinematics and the final states are well defined

6.2.3.11 void GamGam::PrepareHadronisation ( **Particle** \* part\_ )

Sets all the kinematic variables for the outgoing proton remnants in order to be able to hadronise them afterwards

Parameters

in	<i>part_</i>	<a href="#">Particle</a> to "prepare" for the hadronisation to be performed
----	--------------	---

6.2.3.12 bool GamGam::SetIncomingKinematics ( **Particle** ip1\_, **Particle** ip2\_ )

Specifies the incoming particles' kinematics as well as their properties using two [Particle](#) objects.

## Parameters

<b>in</b>	<i>ip1_</i>	Information on the first incoming particle
<b>in</b>	<i>ip2_</i>	Information on the second incoming particle

## Returns

A boolean stating whether or not the incoming kinematics is properly set for this event

6.2.3.13 void GamGam::SetKinematics ( **GamGamKinematics** cuts\_ )

## Parameters

<b>in</b>	<i>cuts_</i>	The Cuts object containing the kinematic parameters
-----------	--------------	---

6.2.3.14 bool GamGam::SetOutgoingParticles ( int part\_, int pdgld\_ )

## Parameters

<b>in</b>	<i>part_</i>	Role of the particle in the process
<b>in</b>	<i>pdgld_</i>	<a href="#">Particle</a> ID according to the PDG convention

## Returns

A boolean stating whether or not the outgoing kinematics is properly set for this event

## 6.3 GamGamKinematics Class Reference

List of kinematic cuts to apply on the central and outgoing phase space.

Collaboration diagram for GamGamKinematics:

## Public Member Functions

- void `Dump` ()  
*Dumps all the parameters used in this process cross-section computation / events generation.*

## Data Fields

- double `emax`  
*Maximal energy of the central two-photons system.*
- double `emin`  
*Minimal energy of the central two-photons system.*
- int `kinematics`  
*Type of kinematics to consider for the phase space.*
- int `mode`  
*Sets of cuts to apply on the final phase space.*
- double `mxmax`  
*Maximal mass (in  $\text{GeV}/c^2$ ) of the outgoing proton remnant(s)*
- double `mxmin`  
*Minimal mass (in  $\text{GeV}/c^2$ ) of the outgoing proton remnant(s)*
- double `ptmax`  
*Maximal transverse momentum of the single outgoing leptons.*
- double `ptmin`  
*Minimal transverse momentum of the single outgoing leptons.*
- double `q2max`  
*The maximal value of  $Q^2$ .*
- double `q2min`  
*The minimal value of  $Q^2$ .*
- double `thetamax`  
*Maximal polar ( $\theta_{\text{max}}$ ) angle of the outgoing leptons, expressed in degrees.*
- double `thetamin`  
*Minimal polar ( $\theta_{\text{min}}$ ) angle of the outgoing leptons, expressed in degrees.*
- double `wmax`  
*The maximal  $s$  on which the cross section is integrated. If negative, the maximal energy available to the system (hence,  $s = (\sqrt{s})^2$ ) is provided.*
- double `wmin`  
*The minimal  $s$  on which the cross section is integrated.*

## 6.3.1 Field Documentation

## 6.3.1.1 int GamGamKinematics::kinematics

Type of kinematics to consider for the process. Can either be :

- 0 for the electron-electron elastic case
- 1 for the proton-proton elastic case
- 2 for the proton-proton single-dissociative (or inelastic) case
- 3 for the proton-proton double-dissociative case

## 6.4 Hadroniser Class Reference

Inheritance diagram for Hadroniser:

Collaboration diagram for Hadroniser:

### Public Member Functions

- `std::vector< Particle > GetHadrons ()`
- `virtual bool Hadronise (Particle *part_)`  
*Main caller to hadronise a particle.*
- `virtual bool Hadronise (Event *ev_)`  
*Hadronises a full event.*

### Protected Attributes

- `std::vector< Particle > * _hadrons`  
*List of hadrons produced by this hadronisation process.*
- `std::string _name`  
*Name of the hadroniser.*

#### 6.4.1 Detailed Description

Class template to define any hadroniser as a general object with defined methods

## Author

Laurent Forthomme [laurent.forthomme@uclouvain.be](mailto:laurent.forthomme@uclouvain.be)

## Date

January 2014

## 6.4.2 Member Function Documentation

6.4.2.1 `std::vector<Particle> Hadroniser::GetHadrons ( ) [inline]`

Gets the full list of hadrons (as [Particle](#) objects) produced by the hadronisation

## Returns

A vector of [Particle](#) containing all the hadrons produced

6.4.2.2 `virtual bool Hadroniser::Hadronise ( Event * ev_ ) [inline], [virtual]`

Launches the hadroniser on the full event information

## Parameters

<code>in,out</code>	<code>ev_</code>	The event to hadronise
---------------------	------------------	------------------------

## Returns

A boolean stating whether or not the hadronisation occurred successfully

Reimplemented in [Pythia6Hadroniser](#), and [Jetset7Hadroniser](#).

Here is the call graph for this function:

## 6.5 Jetset7Hadroniser Class Reference

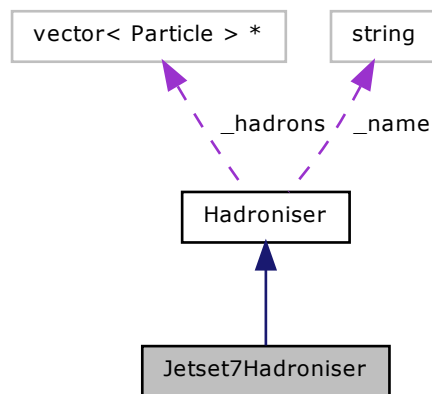

Jetset7 hadronisation algorithm.

Inheritance diagram for Jetset7Hadroniser:

Collaboration diagram for Jetset7Hadroniser:

#### Public Member Functions

- `std::vector< Particle > GetHadrons ()`
- `bool Hadronise (Particle *part_)`  
*Main caller to hadronise a particle.*

- `std::string _name`  
*Name of the hadroniser.*

### 6.5.1 Member Function Documentation

#### 6.5.1.1 `std::vector<Particle> Hadroniser::GetHadrons ( ) [inline], [inherited]`

Gets the full list of hadrons (as [Particle](#) objects) produced by the hadronisation

Returns

A vector of [Particle](#) containing all the hadrons produced

#### 6.5.1.2 `bool Jetset7Hadroniser::Hadronise ( Event * ev_ ) [virtual]`

Launches the hadroniser on the full event information

Parameters

<code>in,out</code>	<code>ev_</code>	The event to hadronise
---------------------	------------------	------------------------

Returns

A boolean stating whether or not the hadronisation occurred successfully

Reimplemented from [Hadroniser](#).

## 6.6 MCGen Class Reference

Core of the Monte-Carlo generator.

Public Member Functions

- [MCGen](#) ([Parameters](#) \*ip\_)  
*Class constructor.*
- void **AnalyzePhaseSpace** (const std::string)
- void [ComputeXsection](#) (double \*xsec\_, double \*err\_)  
*Compute the cross-section for the given process.*
- [Event](#) \* [GenerateOneEvent](#) ()
- [Parameters](#) [GetParameters](#) ()  
*Returns the set of parameters used to setup the phase space to integrate.*
- void [LaunchGeneration](#) ()
- void **Test** ()

### 6.6.1 Detailed Description

This object represents the core of this Monte Carlo generator, with its allowance to generate the events (using the embedded [Vegas](#) object) and to study the phase space in term of the variation of resulting cross section while scanning the various parameters (point **x** in the DIM-dimensional phase space).

The phase space is constrained using the [InputParameters](#) object given as an argument to the constructor, and the differential cross-sections for each value of the array **x** are computed in the f-function defined outside (but populated inside) this object.

This f-function embeds a [GamGam](#) object which defines all the methods to obtain this differential cross-section as well as the in- and outgoing kinematics associated to each particle.

Author

Laurent Forthomme [laurent.forthomme@uclouvain.be](mailto:laurent.forthomme@uclouvain.be)

Date

February 2013

## 6.6.2 Constructor & Destructor Documentation

### 6.6.2.1 MCGen::MCGen ( **Parameters** \* ip\_ )

Sets the number of dimensions on which to perform the integration, according to the set of input parameters given as an argument and propagated to the whole object

Parameters

<b>in</b>	<i>ip_</i>	List of input parameters defining the phase space on which to perform the integration
-----------	------------	---

## 6.6.3 Member Function Documentation

### 6.6.3.1 void MCGen::ComputeXsection ( double \* xsec\_, double \* err\_ )

Computes the cross-section for the run defined by this object. This returns the cross-section as well as the absolute error computed along.

Parameters

<b>out</b>	<i>xsec_</i>	The computed cross-section, in pb
<b>out</b>	<i>err_</i>	The absolute integration error on the computed cross-section, in pb

### 6.6.3.2 **Event\*** MCGen::GenerateOneEvent ( )

Generates one single event given the phase space computed by [Vegas](#) in the integration step

Returns

A pointer to the [Event](#) object generated in this run

### 6.6.3.3 **Parameters** MCGen::GetParameters ( ) [inline]

Returns

The Parameter object embedded in this class

### 6.6.3.4 void MCGen::LaunchGeneration ( )

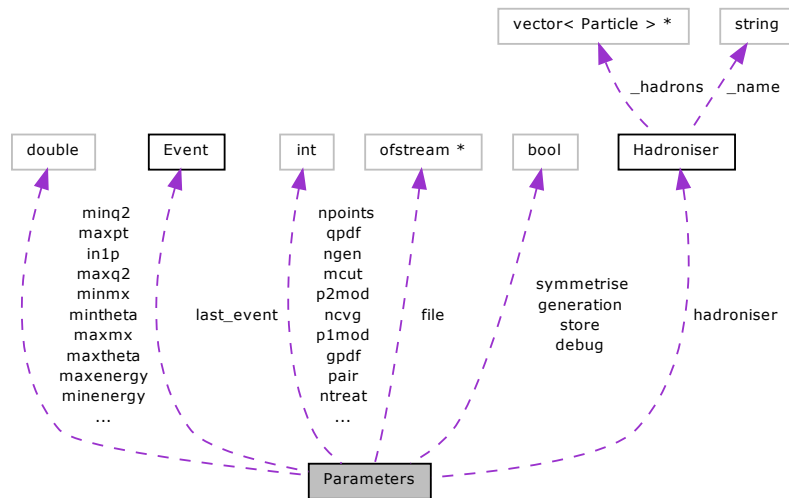

Launches the full events generation

**Deprecated** This method is to be suppressed since the events generation can now be launched one event at a time using the *GenerateOneEvent* method

## 6.7 Parameters Class Reference

List of parameters used to start and run the simulation job.

Collaboration diagram for Parameters:

## Public Member Functions

- void **Dump** ()  
*Dumps the input parameters in the console.*
- bool **ReadConfigFile** (std::string inFile\_)  
*Reads content from config file to load the variables.*
- void **SetEtaRange** (double etamin\_, double etamax\_)  
*Sets the pseudo-rapidity range for the produced leptons.*
- bool **StoreConfigFile** (std::string outFile\_)  
*Stores the full run configuration to an external config file.*

## Data Fields

- bool **debug**  
*Do we need control plots all along the process?*
- std::ofstream \* **file**  
*The file in which to store the events generation's output.*
- bool **generation**  
*Are we generating events ? (true) or are we only computing the cross-section ? (false)*
- int **gpdf**  
*PDFLIB group to use.*
- **Hadroniser** \* **hadroniser**  
*Hadronisation algorithm to use for the proton(s) remnants fragmentation.*
- double **in1p**  
*First incoming particle's momentum (in GeV/c)*
- double **in2p**  
*Second incoming particle's momentum (in GeV/c)*
- int **itvg**  
*Maximal number of iterations to perform by VEGAS.*

- `Event * last_event`  
*The pointer to the last event produced in this run.*
- `double maxenergy`  
*Maximal energy of the outgoing leptons.*
- `int maxgen`  
*Maximal number of events to generate in this run.*
- `double maxmx`  
*Maximal  $M_X$  of the outgoing proton remnants.*
- `double maxpt`  
*Maximal  $p_T$  of the outgoing leptons.*
- `double maxq2`  
*Maximal value of  $Q^2$ , the internal photons lines' virtuality.*
- `double maxtheta`  
*Maximal polar angle  $\theta$  of the outgoing leptons.*
- `int mcut`  
*Set of cuts to apply on the outgoing leptons.*
- `double minenergy`  
*Minimal energy of the outgoing leptons.*
- `double minmx`  
*Minimal  $M_X$  of the outgoing proton remnants.*
- `double minpt`  
*Minimal  $p_T$  of the outgoing leptons.*
- `double minq2`  
*Minimal value of  $Q^2$ , the internal photons lines' virtuality.*
- `double mintheta`  
*Minimal polar angle  $\theta$  of the outgoing leptons.*
- `int ncvg`
- `int ngen`  
*Number of events already generated in this run.*
- `int npoints`  
*Number of points to "shoot" in each integration bin by the algorithm.*
- `int ntreat`  
*Maximal number of TREAT calls.*
- `int p1mod`  
*First particle's mode.*
- `int p2mod`  
*Second particle's mode.*
- `int pair`  
*PDG id of the outgoing leptons.*
- `int qpdf`  
*Number of quarks.*
- `int spdf`  
*PDFLIB set to use.*
- `bool store`  
*Are the events generated in this run to be stored in the output file ?*
- `bool symmetrise`  
*Control plots objects.*

## 6.7.1 Detailed Description

## Note

The default parameters are derived from GMUINI in LPAIR

## 6.7.2 Member Function Documentation

## 6.7.2.1 bool Parameters::ReadConfigFile ( std::string inFile\_ )

Reads the list of parameters to be used in this cross-section computation/events generation from an external input card.

## Parameters

<b>in</b>	<i>inFile_</i>	Name of the configuration file to load
-----------	----------------	--

## Returns

A boolean stating whether this input configuration file is correct or not

## 6.7.2.2 void Parameters::SetEtaRange ( double etamin\_, double etamax\_ )

Defines the range to cover in pseudo-rapidity for the outgoing leptons produced in this process. This method converts this range into a range in  $\theta$ , the polar angle.

## Parameters

<b>in</b>	<i>etamin_</i>	The minimal value of $\eta$ for the outgoing leptons
<b>in</b>	<i>etamax_</i>	The maximal value of $\eta$ for the outgoing leptons

## 6.7.2.3 bool Parameters::StoreConfigFile ( std::string outFile\_ )

## Parameters

<b>in</b>	<i>outFile_</i>	Name of the configuration file to create
-----------	-----------------	--

## Returns

A boolean stating whether this output configuration file is correctly written or not

## 6.7.3 Field Documentation

## 6.7.3.1 bool Parameters::debug

Enables or disables the production of control plots for several kinematic quantities in this process

## 6.7.3.2 double Parameters::maxmx

Maximal mass of the outgoing proton remnants,  $M_X$ , in  $\text{GeV}/c^2$ .

## 6.7.3.3 double Parameters::maxpt

Maximal transverse momentum cut to apply on the outgoing lepton(s)

## 6.7.3.4 int Parameters::mcut

Set of cuts to apply on the outgoing leptons in order to restrain the available kinematic phase space :

- 0 - No cuts at all (for the total cross section)

- 1 - Vermaserens' hypothetical detector cuts : for both leptons,
  - $\frac{|p_z|}{|\mathbf{p}|} \leq 0.75$  and  $p_T \geq 1 \text{ GeV}/c$ , or
  - $0.75 < \frac{|p_z|}{|\mathbf{p}|} \leq 0.95$  and  $p_z > 1 \text{ GeV}/c$ ,
- 2 - Cuts on both the outgoing leptons, according to the provided cuts parameters
- 3 - Cuts on at least one outgoing lepton, according to the provided cut parameters

#### 6.7.3.5 double Parameters::minmx

Minimal mass of the outgoing proton remnants,  $M_X$ , in  $\text{GeV}/c^2$ .

#### 6.7.3.6 double Parameters::minpt

Minimal transverse momentum cut to apply on the outgoing lepton(s)

#### 6.7.3.7 int Parameters::ntreat

Note

Is it correctly implemented ?

#### 6.7.3.8 int Parameters::p1mod

The first incoming particle type and kind of interaction :

- 1 - electron,
- 2 - proton elastic,
- 3 - proton inelastic without parton treatment,
- 4 - proton inelastic in parton model

Note

Was named PMOD in ILPAIR

#### 6.7.3.9 int Parameters::p2mod

Note

Was named EMOD in ILPAIR

#### 6.7.3.10 int Parameters::pair

The particle code of produced leptons, as defined by the PDG convention :

- 11 - for  $e^+e^-$  pairs
- 13 - for  $\mu^+\mu^-$  pairs
- 15 - for  $\tau^+\tau^-$  pairs

#### 6.7.3.11 bool Parameters::symmetrise

List of Gnuplot objects which can be used to produce control plots all along the cross-section determination and events generation process

Note

Maximum number of these can be raised in the [utils.h](#) file, but pay attention to the memory load since these Gnuplot objects are still under development!

## 6.8 Particle Class Reference

Kinematics of one particle.

Collaboration diagram for Particle:

### Public Member Functions

- `Particle` (int role\_, int pdgId\_=0)  
*Object constructor (providing the role of the particle in the process, and its `Particle` Data Group identifier)*
- bool `AddDaughter` (`Particle` \*part\_)  
*Specify a decay product for this particle.*
- void `Dump` ()  
*Dumps all the information on this particle.*
- void `E` (double E\_)  
*Sets the particle's energy.*
- double `E` ()  
*Gets the particle's energy.*
- double `Eta` ()  
*Pseudo-rapidity.*
- `std::vector< int >` `GetDaughters` ()  
*Gets a vector containing all the daughters unique identifiers from this particle.*
- `std::string` `GetLHEline` (bool revert\_=false)
- int `GetMother` ()  
*Gets the unique identifier to the mother particle from which this particle arises.*
- bool `Hadronise` (std::string algo\_)  
*Hadronises the particle using Pythia.*
- double `M` ()  
*Gets the particle's mass.*
- bool `M` (double m\_)  
*Set the particle's mass in  $\text{GeV}/c^2$ .*
- double `M2` ()  
*Gets the particle's squared mass.*
- unsigned int `NumDaughters` ()  
*Gets the number of daughter particles arising from this one.*

- `bool operator< (const Particle &rhs)`  
*Comparison operator to enable the sorting of particles in an event according to their unique identifier.*
- `Particle & operator= (const Particle &)`  
*Copies all the relevant quantities from one Particle object to another.*
- `bool P (double px_, double py_, double pz_)`  
*Sets the 3-momentum associated to the particle.*
- `bool P (double px_, double py_, double pz_, double E_)`  
*Sets the 4-momentum associated to the particle.*
- `bool P (double p_[3], double E_)`  
*Sets the 4-momentum associated to the particle.*
- `bool P (double p_[4])`  
*Sets the 4-momentum associated to the particle.*
- `double P ()`  
*Norm of the 3-momentum, in GeV/c.*
- `double * P3 ()`  
*Returns the particle's 3-momentum.*
- `double * P4 ()`  
*Returns the particle's 4-momentum.*
- `void PDF2PDG ()`
- `double Phi ()`
- `bool Primary ()`  
*Is this particle a primary particle ?*
- `double Pt ()`  
*Transverse momentum, in GeV/c.*
- `double Rapidity ()`  
*Rapidity.*
- `void SetMother (Particle *part_)`  
*Sets the mother particle (from which this particle arises)*
- `bool Valid ()`  
*Is this particle a valid particle which can be used for kinematic computations ?*

#### Data Fields

- `float charge`  
*The particle's electric charge (given as a float number, for the quarks and bound states)*
- `int id`  
*Unique identifier of the particle (in a Event object context)*
- `std::string name`  
*Particle's name in a human-readable format.*
- `int pdgId`  
*Particle Data Group integer identifier.*
- `double px`  
*Momentum along the x-axis in GeV/c.*
- `double py`  
*Momentum along the y-axis in GeV/c.*
- `double pz`  
*Momentum along the z-axis in GeV/c.*
- `int role`  
*Role in the considered process.*
- `int status`  
*Particle status.*

## 6.8.1 Detailed Description

Kinematic information for one particle

## 6.8.2 Member Function Documentation

6.8.2.1 `bool Particle::AddDaughter ( Particle * part_ )`

Adds a "daughter" to this particle (one of its decay product(s))

Parameters

<b>in</b>	<i>part_</i>	The <a href="#">Particle</a> object in which this particle will desintegrate or convert
-----------	--------------	---

Returns

A boolean stating if the particle has been added to the daughters list or if it was already present before

6.8.2.2 `void Particle::Dump ( )`

Dumps into the standard output stream all the available information on this particle

6.8.2.3 `void Particle::E ( double E_ ) [inline]`

Parameters

<b>in</b>	<i>E_</i>	Energy, in GeV
-----------	-----------	----------------

6.8.2.4 `double Particle::Eta ( ) [inline]`

Computes and returns  $\eta$ , the pseudo-rapidity of the particle

Returns

The pseudo-rapidity of the particle

Here is the call graph for this function:

6.8.2.5 `std::vector<int> Particle::GetDaughters ( )`

Returns

An integer vector containing all the daughters' unique identifier in the event

6.8.2.6 `std::string Particle::GetLHEline ( bool revert_ = false )`

Returns a string containing all the particle's kinematics as expressed in the Les Houches format

## Parameters

<code>in</code>	<code>revert_</code>	Is the event symmetric ? If set to true, the third component of the momentum is reverted.
-----------------	----------------------	---

## Returns

The LHE line associated to the particle, and containing the particle's history (mother/daughters), its kinematics, and its status

6.8.2.7 `int Particle::GetMother ( ) [inline]`

## Returns

An integer representing the unique identifier to the mother of this particle in the event

6.8.2.8 `bool Particle::Hadronise ( std::string algo_ )`

Hadronises the particle with Pythia, and builds the shower (list of [Particle](#) objects) embedded in this object

## Parameters

<code>in</code>	<code>algo_</code>	Algorithm in use to hadronise the particle
-----------------	--------------------	--

6.8.2.9 `double Particle::M ( ) [inline]`

Gets the particle's mass in  $\text{GeV}/c^2$ .

## Returns

The particle's mass

6.8.2.10 `bool Particle::P ( double px_, double py_, double pz_ ) [inline]`

## Parameters

<code>in</code>	<code>px_</code>	Momentum along the $x$ -axis, in $\text{GeV}/c$
<code>in</code>	<code>py_</code>	Momentum along the $y$ -axis, in $\text{GeV}/c$
<code>in</code>	<code>pz_</code>	Momentum along the $z$ -axis, in $\text{GeV}/c$

## Returns

A boolean stating the validity of this particle (according to its 4-momentum norm)

Here is the call graph for this function:

6.8.2.11 `bool Particle::P ( double px_, double py_, double pz_, double E_ ) [inline]`

Sets the 4-momentum associated to the particle, and computes its (invariant) mass.

## Parameters

in	$px\_$	Momentum along the $x$ -axis, in GeV/c
in	$py\_$	Momentum along the $y$ -axis, in GeV/c
in	$pz\_$	Momentum along the $z$ -axis, in GeV/c
in	$E\_$	Energy, in GeV

## Returns

A boolean stating the validity of the particle's kinematics

Here is the call graph for this function:

6.8.2.12 `bool Particle::P ( double p_[3], double E_ )`

## Parameters

<b>in</b>	$p_{-}$	3-momentum
<b>in</b>	$E_{-}$	Energy, in GeV

## Returns

A boolean stating the validity of the particle's kinematics

6.8.2.13 `bool Particle::P ( double p_[4] ) [inline]`

## Parameters

<b>in</b>	$p_{-}$	4-momentum
-----------	---------	------------

## Returns

A boolean stating the validity of the particle's kinematics

Here is the call graph for this function:

6.8.2.14 `double Particle::P ( ) [inline]`

## Returns

The particle's 3-momentum norm as a double precision float

Here is the call graph for this function:

6.8.2.15 `double* Particle::P3 ( ) [inline]`

## Returns

The particle's 3-momentum as a 3 components double array

6.8.2.16 `double* Particle::P4 ( ) [inline]`

Builds and returns the particle's 4-momentum as an array ordered as  $(\mathbf{p}, E) = (p_x, p_y, p_z, E)$

Returns

The particle's 4-momentum as a 4 components double array

Here is the call graph for this function:

6.8.2.17 `double Particle::Rapidity ( ) [inline]`

Computes and returns  $y$ , the rapidity of the particle

Returns

The rapidity of the particle

Here is the call graph for this function:

6.8.2.18 `void Particle::SetMother ( Particle * part_ )`

Sets the "mother" of this particle (particle from which this particle is issued)

Parameters

<b>in</b>	<i>part_</i>	A <a href="#">Particle</a> object containing all the information on the mother particle
-----------	--------------	---

## 6.8.3 Field Documentation

6.8.3.1 `int Particle::pdgId`

Unique identifier for a particle type. From[1] : *The Monte Carlo particle numbering scheme [...] is intended to facilitate interfacing between event generators, detector simulators, and analysis packages used in particle physics.*

### 6.8.3.2 int Particle::status

Codes 1-10 correspond to currently existing partons/particles, and larger codes contain partons/particles which no longer exist, or other kinds of event information

## 6.9 Process Class Reference

Inheritance diagram for Process:

### Public Member Functions

- double `ComputeWeight ()`

*Returns the weight for this point in the phase-space.*

### 6.9.1 Detailed Description

Class template to define any process to compute using this MC integrator/generator

Author

Laurent Forthomme [laurent.forthomme@uclouvain.be](mailto:laurent.forthomme@uclouvain.be)

Date

January 2014

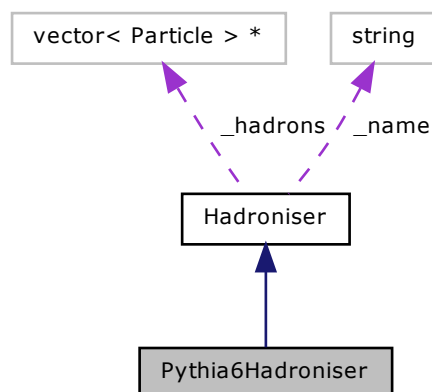

## 6.10 Pythia6Hadroniser Class Reference

Pythia6 hadronisation algorithm.

Inheritance diagram for Pythia6Hadroniser:

Collaboration diagram for Pythia6Hadroniser:

### Public Member Functions

- `std::vector< Particle > GetHadrons ()`
- `bool Hadronise (Particle *part_)`  
Main caller to hadronise a particle.
- `bool Hadronise (Event *ev_)`  
Hadronises a full event.

## Protected Attributes

- `std::vector< Particle > * _hadrons`  
*List of hadrons produced by this hadronisation process.*
- `std::string _name`  
*Name of the hadroniser.*

## 6.10.1 Member Function Documentation

6.10.1.1 `std::vector<Particle> Hadroniser::GetHadrons ( ) [inline], [inherited]`

Gets the full list of hadrons (as [Particle](#) objects) produced by the hadronisation

## Returns

A vector of [Particle](#) containing all the hadrons produced

6.10.1.2 `bool Pythia6Hadroniser::Hadronise ( Event * ev_ ) [virtual]`

Launches the hadroniser on the full event information

## Parameters

<code>in, out</code>	<code>ev_</code>	The event to hadronise
----------------------	------------------	------------------------

## Returns

A boolean stating whether or not the hadronisation occurred successfully

Reimplemented from [Hadroniser](#).

## 6.11 Vegas Class Reference

[Vegas](#) Monte-Carlo integrator instance.

## Public Member Functions

- [Vegas](#) (const int dim\_, double f\_(double \*, size\_t, void \*), [Parameters](#) \*inParam\_)
- [~Vegas](#) ()  
*Class destructor.*
- void [Generate](#) ()  
*Launches the generation of events.*
- bool [GenerateOneEvent](#) ()  
*Generates one single event according to the method defined in the Fortran 77 version of LPAIR.*
- int [Integrate](#) (double \*result\_, double \*abserr\_)

## 6.11.1 Detailed Description

Main occurrence of the Monte-Carlo integrator[2] developed by G.P. Lepage in 1978

## 6.11.2 Constructor &amp; Destructor Documentation

6.11.2.1 `Vegas::Vegas ( const int dim_, double f_double *, size_t, void *, Parameters * inParam_ )`

Constructs the class by booking the memory and structures for the [Vegas](#) integrator. This code is based on the [Vegas](#) Monte Carlo integration algorithm developed by P. Lepage, as documented in[2]

## Parameters

in	<i>dim_</i>	The number of dimensions on which the function will be integrated
in	<i>f_</i>	The function one is required to integrate
in,out	<i>inParam_</i>	A list of parameters to define the phase space on which this integration is performed (embedded in an <a href="#">Parameters</a> object)

## 6.11.3 Member Function Documentation

## 6.11.3.1 void Vegas::Generate ( )

Launches the [Vegas](#) generation of events according to the provided input parameters.

## 6.11.3.2 bool Vegas::GenerateOneEvent ( )

Generates one event according to the grid parameters set in Vegas::SetGen

## Returns

A boolean stating if the generation was successful (in term of the computed weight for the phase space point)

## 6.11.3.3 int Vegas::Integrate ( double \* result\_, double \* abserr\_ )

[Vegas](#) algorithm to perform the (*\_dim*)-dimensional Monte Carlo integration of a given function as described in[2]

## Author

Primary author : G.P. Lepage  
This C++ implementation : L. Forthomme

## Date

September 1976  
Reviewed in Apr 1978  
FTN5 version 21 Aug 1984  
This C++ implementation is from 12 Dec 2013

## Parameters

out	<i>result_</i>	The cross section as integrated by <a href="#">Vegas</a> for the given phase space restrictions
out	<i>abserr_</i>	The error associated to the computed cross section

## Returns

0 if the integration was performed successfully
