1 Todo List

Global `GamGam::GamGam` (`const unsigned int ndim_`, `int nOpt_`, `double x_[]`)

Figure out how this `nOpt_` parameter is affecting the final cross-section computation and events generation

2 Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

| | |
|--------------------------|-----------|
| Event | 3 |
| GamGam | 4 |
| GamGamKinematics | 7 |
| InputParameters | 11 |
| MCGen | 14 |
| Particle | 15 |
| InelasticParticle | 8 |
| Vegas | 18 |

3 Data Structure Index

3.1 Data Structures

Here are the data structures with brief descriptions:

| | |
|-----------------------------------------------------------------------------------|-----------|
| Event | |
| Kinematic information on the particles in the event | 3 |
| GamGam | |
| Computes the matrix element for a $\gamma\gamma \rightarrow \ell^+\ell^-$ process | 4 |
| GamGamKinematics | |
| List of kinematic cuts to apply on the central and outgoing phase space | 7 |
| InelasticParticle | 8 |
| InputParameters | |
| List of input parameters used to start and run the simulation job | 11 |
| MCGen | |
| Core of the Monte-Carlo generator | 14 |
| Particle | |
| Kinematics of one particle | 15 |
| Vegas | |
| Vegas Monte-Carlo integrator instance | 18 |

4 Data Structure Documentation

4.1 Event Class Reference

Kinematic information on the particles in the event.

Public Member Functions

- void [Dump](#) ()
- [Particle](#) * [GetByRole](#) (int role_)
- int [SetParticle](#) ([Particle](#) *part_)
- void [Store](#) (std::ofstream *, double weight_=1.)
- void [StoreLHERRecord](#) (std::ofstream *of_, const double weight_=1.)

Stores the LHE block for this event.

4.1.1 Detailed Description

Class containing all the information on the in- and outgoing particles' kinematics

4.1.2 Member Function Documentation

4.1.2.1 void Event::Dump ()

Dumps all the known information on every [Particle](#) object contained in this [Event](#) container in the output stream

4.1.2.2 Particle* Event::GetByRole (int role_)

Returns the pointer to the [Particle](#) object corresponding to a certain role in the process kinematics

Parameters

| | |
|--------------|--------------------------------------------------|
| <i>role_</i> | The role the particle has to play in the process |
|--------------|--------------------------------------------------|

Returns

A pointer to the requested [Particle](#) object

4.1.2.3 int Event::SetParticle (Particle * part_)

Sets the information on one particle in the process

Parameters

| | |
|--------------|----------------------------------------------------------------------|
| <i>part_</i> | The Particle object to insert or modify in the event |
|--------------|----------------------------------------------------------------------|

Returns

- 1 if a new [Particle](#) object has been inserted in the event
- 0 if an existing [Particle](#) object has been modified
- -1 if the requested role to edit is undefined or incorrect

4.1.2.4 void Event::Store (std::ofstream *, double weight_ = 1.)

Stores in a file (raw format) all the kinematics on the outgoing leptons

Parameters

| | |
|-----------------------|-------------------------|
| <code>weight__</code> | The weight of the event |
|-----------------------|-------------------------|

4.1.2.5 void Event::StoreLHERRecord (std::ofstream * of_, const double weight_ = 1.)

Stores in a LHE format (a XML-style) all the information on the particles composing this event

Parameters

| | |
|-----------------------|-----------------------------------------------------------|
| <code>of__</code> | The file stream on which the event record has to be saved |
| <code>weight__</code> | The weight of the event |

The documentation for this class was generated from the following file:

- include/event.h

4.2 GamGam Class Reference

Computes the matrix element for a $\gamma\gamma \rightarrow \ell^+\ell^-$ process.

Public Member Functions

- [GamGam](#) (const unsigned int ndim_, int nOpt_, double x_[])
Class constructor.
- void [ComputeSqS](#) ()
Computes \sqrt{s} for the system.
- double [ComputeXsec](#) (int nm_=1)
Computes the process' cross section.
- [Particle](#) * [GetParticle](#) (int role_)
Get a particle given its role in the process.
- double [GetT1](#) ()
- void [GetT1extrema](#) (double &t1min_, double &t1max_)
- double [GetT2](#) ()
- void [GetT2extrema](#) (double &t2min_, double &t2max_)
- bool [IsKinematicsDefined](#) ()
Is the system's kinematics well defined?
- void [SetCuts](#) ([GamGamKinematics](#) cuts_)
Sets the list of kinematic cuts to apply on the outgoing particles' final state.
- bool [SetIncomingKinematics](#) (int part_, double momentum_[3], int pdgId_)
Sets the momentum and PDG id for the incoming particles.
- bool [SetIncomingKinematics](#) ([Particle](#) ip1_, [Particle](#) ip2_)
Sets the momentum and PDG id for the incoming particles.
- bool [SetOutgoingParticles](#) (int part_, int pdgId_)
Sets the PDG id for the outgoing particles.

4.2.1 Detailed Description

Full class of methods and objects to compute the full analytic matrix element [2] for the $\gamma\gamma \rightarrow \ell^+\ell^-$ process according to a set of kinematic constraints provided for the incoming and outgoing particles (the [GamGamKinematics](#) object).

4.2.2 Constructor & Destructor Documentation

4.2.2.1 GamGam::GamGam (const unsigned int *ndim_*, int *nOpt_*, double *x_[]*)

Sets the mandatory parameters used in the methods computing the kinematics and the cross-section of this phase space point.

Parameters

| | |
|--------------|----------------------------------------------------------------------------------------------------------------------|
| <i>ndim_</i> | The number of dimensions of the point in the phase space |
| <i>nOpt_</i> | Optimisation??? |
| <i>x_[]</i> | The (<i>ndim_</i>)-dimensional point in the phase space on which the kinematics and the cross-section are computed |

Todo Figure out how this *nOpt_* parameter is affecting the final cross-section computation and events generation

4.2.3 Member Function Documentation

4.2.3.1 void GamGam::ComputeSqS ()

Computes the centre of mass energy for the system, according to the incoming particles' kinematics

4.2.3.2 double GamGam::ComputeXsec (int *nm_* = 1)

Computes the cross-section for the $\gamma\gamma \rightarrow \ell^+\ell^-$ process with the given kinematics

Returns

$\frac{d\sigma}{dx}(\gamma\gamma \rightarrow \ell^+\ell^-)$, the differential cross-section for the given point in the phase space.

4.2.3.3 Particle* GamGam::GetParticle (int *role_*)

Parameters

| | |
|--------------|----------------------------------------------------------------------------|
| <i>role_</i> | An integer denoting the particle's role in the selected production process |
|--------------|----------------------------------------------------------------------------|

4.2.3.4 double GamGam::GetT1 () [inline]

Returns the value for the first photon virtuality

Returns

t_1 , the first photon virtuality

4.2.3.5 void GamGam::GetT1extrema (double & *t1min_*, double & *t1max_*) [inline]

Returns the two limit values for the first photon virtuality

Parameters

| | |
|---------------|-----------------------------|
| <i>t1min_</i> | The minimal value for t_1 |
| <i>t1max_</i> | The maximal value for t_1 |

4.2.3.6 double GamGam::GetT2 () [inline]

Returns the value for the second photon virtuality

Returns

t_2 , the second photon virtuality

4.2.3.7 `void GamGam::GetT2extrema (double & t2min_, double & t2max_) [inline]`

Returns the two limit values for the second photon virtuality

Parameters

| | |
|---------------------|-----------------------------|
| <code>t2min_</code> | The minimal value for t_2 |
| <code>t2max_</code> | The maximal value for t_2 |

4.2.3.8 `bool GamGam::IsKinematicsDefined () [inline]`

Is the system's kinematics well defined and compatible with the process ? This check is mandatory to perform the (`_ndim`)-dimensional point's cross-section computation.

Returns

A boolean stating if the input kinematics and the final states are well defined

4.2.3.9 `void GamGam::SetCuts (GamGamKinematics cuts_)`

Parameters

| | |
|--------------------|-----------------------------------------------------|
| <code>cuts_</code> | The Cuts object containing the kinematic parameters |
|--------------------|-----------------------------------------------------|

4.2.3.10 `bool GamGam::SetIncomingKinematics (int part_, double momentum_[3], int pdgld_)`

Specifies the incoming particles' kinematics as well as their properties (role in the process and code according to the PDG convention)

Parameters

| | |
|---------------------------|-------------------------------------------------------------|
| <code>part_</code> | Role of the particle in the process |
| <code>momentum_[]</code> | 3-momentum of the particle |
| <code>pdgld_</code> | Particle ID according to the PDG convention |

Returns

True if the kinematics was correctly set for the given particle role

4.2.3.11 `bool GamGam::SetIncomingKinematics (Particle ip1_, Particle ip2_)`

Specifies the incoming particles' kinematics as well as their properties using two [Particle](#) objects.

Parameters

| | |
|-------------------|---------------------------------------------|
| <code>ip1_</code> | Information on the first incoming particle |
| <code>ip2_</code> | Information on the second incoming particle |

4.2.3.12 `bool GamGam::SetOutgoingParticles (int part_, int pdgld_)`

Parameters

| | |
|---------------------|-------------------------------------------------------------|
| <code>part_</code> | Role of the particle in the process |
| <code>pdgld_</code> | Particle ID according to the PDG convention |

The documentation for this class was generated from the following file:

- include/gamgam.h

4.3 GamGamKinematics Class Reference

List of kinematic cuts to apply on the central and outgoing phase space.

Data Fields

- double `emax`
Maximal energy of the central two-photons system.
- double `emin`
Minimal energy of the central two-photons system.
- int `kinematics`
Type of kinematics to consider for the phase space.
- int `mode`
Sets of cuts to apply on the final phase space.
- double `ptmax`
Maximal transverse momentum of the single outgoing leptons.
- double `ptmin`
Minimal transverse momentum of the single outgoing leptons.
- double `q2max`
The maximal value of Q^2 .
- double `q2min`
The minimal value of Q^2 .
- double `thetamax`
Maximal polar (θ_{\max}) angle of the outgoing leptons, expressed in degrees.
- double `thetamin`
Minimal polar (θ_{\min}) angle of the outgoing leptons, expressed in degrees.
- double `wmax`
The maximal s on which the cross section is integrated. If negative, the maximal energy available to the system (hence, $s = (\sqrt{s})^2$) is provided.
- double `wmin`
The minimal s on which the cross section is integrated.

4.3.1 Field Documentation

4.3.1.1 int GamGamKinematics::kinematics

Type of kinematics to consider for the process. Can either be :

- 0 for the electron-electron elastic case
- 1 for the proton-proton elastic case
- 2 for the proton-proton single-dissociative (or inelastic) case
- 3 for the proton-proton double-dissociative case

The documentation for this class was generated from the following file:

- include/gamgam.h

4.4 InelasticParticle Class Reference

Inheritance diagram for InelasticParticle:

Public Member Functions

- void [AddDaughter](#) ([Particle](#) *part_)
Specify a decay product for this particle.
- [Particle](#) * [GetDaughter](#) (const unsigned int num_=0)
Gets a daughter from this particle, labelled by its identifier in this particle's daughters list.
- std::string [GetLHELine](#) (bool revert_=false)
- [Particle](#) * [GetMother](#) ()
Gets the mother particle from which this particle arises.
- void [Hadronise](#) ()
Hadronises the particle using Pythia.
- double [M2](#) ()
Gets the particle's squared mass.
- unsigned int [NumDaughters](#) ()
Gets the number of daughter particles arising from this one.
- void [SetE](#) (double E_)
Sets the particle's energy.
- void [SetMother](#) ([Particle](#) *part_)
Sets the mother particle (from which this particle arises)
- bool [SetP](#) (double px_, double py_, double pz_)
Sets the 3-momentum associated to the particle.
- bool [SetP](#) (double px_, double py_, double pz_, double E_)
Sets the 4-momentum associated to the particle.
- bool [SetP](#) (double p_[3], double E_)
Sets the 4-momentum associated to the particle.

Data Fields

- double [e](#)
Energy, in GeV.
- double [eta](#)
Pseudo-rapidity.
- bool [isValid](#)
Is this particle a valid particle which can be used for kinematic computations ?

- double `m`
Mass in GeV/c^2 .
- double `p`
Norm of the 3-momentum, in GeV/c .
- int `pdgId`
Particle Data Group integer identifier.
- double `pt`
Transverse momentum, in GeV/c .
- double `px`
Momentum along the x -axis in GeV/c .
- double `py`
Momentum along the y -axis in GeV/c .
- double `pz`
Momentum along the z -axis in GeV/c .
- int `role`
Role in the considered process.
- int `status`
Particle status.

4.4.1 Detailed Description

Class containing the information on a particle supposed to decay or fragment in the process

4.4.2 Member Function Documentation

4.4.2.1 void Particle::AddDaughter (Particle * *part_*) [inherited]

Parameters

| | |
|--------------|-----------------------------------------------------------------------------------------|
| <i>part_</i> | The Particle object in which this particle will desintegrate or convert |
|--------------|-----------------------------------------------------------------------------------------|

4.4.2.2 Particle* Particle::GetDaughter (const unsigned int *num_* = 0) [inherited]

Returns

A [Particle](#) object containing all the kinematic information related to this daughter particle

4.4.2.3 std::string Particle::GetLHEline (bool *revert_* = false) [inherited]

Returns a string containing all the particle's kinematics as expressed in the Les Houches format

Parameters

| | |
|----------------|-------------------------------------------------------------------------------------------|
| <i>revert_</i> | Is the event symmetric ? If set to true, the third component of the momentum is reverted. |
|----------------|-------------------------------------------------------------------------------------------|

Returns

The LHE line associated to the particle, and containing the particle's history (mother/daughters), its kinematics, and its status

4.4.2.4 void InelasticParticle::Hadronise ()

Hadronises the particle with Pythia, and builds the shower (list of [Particle](#) objects) embedded in this object

4.4.2.5 void Particle::SetE (double *E_*) [inline], [inherited]

Parameters

| | |
|-------|----------------|
| $E_$ | Energy, in GeV |
|-------|----------------|

4.4.2.6 void Particle::SetMother (Particle * *part_*) [inline], [inherited]

Parameters

| | |
|--------------|-----------------------------------------------------------------------------------------|
| <i>part_</i> | A Particle object containing all the information on the mother particle |
|--------------|-----------------------------------------------------------------------------------------|

4.4.2.7 bool Particle::SetP (double *px_*, double *py_*, double *pz_*) [inline], [inherited]

Parameters

| | |
|------------|---------------------------------------------|
| <i>px_</i> | Momentum along the <i>x</i> -axis, in GeV/c |
| <i>py_</i> | Momentum along the <i>y</i> -axis, in GeV/c |
| <i>pz_</i> | Momentum along the <i>z</i> -axis, in GeV/c |

4.4.2.8 bool Particle::SetP (double *px_*, double *py_*, double *pz_*, double *E_*) [inline], [inherited]

Sets the 4-momentum associated to the particle, and computes its (invariant) mass.

Parameters

| | |
|------------|---------------------------------------------|
| <i>px_</i> | Momentum along the <i>x</i> -axis, in GeV/c |
| <i>py_</i> | Momentum along the <i>y</i> -axis, in GeV/c |
| <i>pz_</i> | Momentum along the <i>z</i> -axis, in GeV/c |
| <i>E_</i> | Energy, in GeV |

Here is the call graph for this function:

4.4.2.9 bool Particle::SetP (double *p_[3]*, double *E_*) [inherited]

Parameters

| | |
|-----------|----------------|
| <i>p_</i> | 3-momentum |
| <i>E_</i> | Energy, in GeV |

4.4.3 Field Documentation

4.4.3.1 int Particle::status [inherited]

Codes 1-10 correspond to currently existing partons/particles, and larger codes contain partons/particles which no longer exist, or other kinds of event information

The documentation for this class was generated from the following file:

- include/inelastic.h

4.5 InputParameters Class Reference

List of input parameters used to start and run the simulation job.

Public Member Functions

- void [Dump](#) ()
Dumps the input parameters in the console.
- bool [ReadConfigFile](#) (std::string inFile_)
Reads content from config file to load the variables.
- bool [StoreConfigFile](#) (std::string outFile_)
Stores the full run configuration to an external config file.

Data Fields

- bool [debug](#)
Do we need control plots all along the process?
- std::ofstream * [file](#)
The file in which to store the events generation's output.
- bool [generation](#)
Are we generating events ? (true) or are we only computing the cross-section ? (false)
- double [in1p](#)
First incoming particle's momentum (in GeV/c)
- double [in2p](#)
Second incoming particle's momentum (in GeV/c)
- int [itvg](#)
Maximal number of iterations to perform by VEGAS.
- double [maxenergy](#)
Maximal energy of the outgoing leptons.
- int [maxgen](#)
Maximal number of events to generate in this run.
- double [maxmx](#)
Maximal M_X of the outgoing proton remnants.
- double [maxpt](#)
Maximal p_T of the outgoing leptons.
- double [maxtheta](#)
Maximal polar angle θ of the outgoing leptons.
- int [mcut](#)
Set of cuts to apply on the outgoing leptons.
- double [minenergy](#)
Minimal energy of the outgoing leptons.
- double [minmx](#)
Minimal M_X of the outgoing proton remnants.
- double [minpt](#)
Minimal p_T of the outgoing leptons.
- double [mintheta](#)
Minimal polar angle θ of the outgoing leptons.
- int [ngen](#)

- `int ntreat`
Number of events already generated in this run.
- `int p1mod`
Maximal number of TREAT calls.
- `int p2mod`
First particle's mode.
- `int pair`
Second particle's mode.
- `bool store`
PDG id of the outgoing leptons.
- `bool symmetrise`
Are the events generated in this run to be stored in the output file ?
- `bool symmetrise`
Control plots objects.

4.5.1 Detailed Description

Note

The default parameters are derived from GMUINI in LPAIR

4.5.2 Member Function Documentation

4.5.2.1 `bool InputParameters::ReadConfigFile (std::string inFile_)`

Parameters

| | |
|----------------------|----------------------------------------|
| <code>inFile_</code> | Name of the configuration file to load |
|----------------------|----------------------------------------|

4.5.2.2 `bool InputParameters::StoreConfigFile (std::string outFile_)`

Parameters

| | |
|-----------------------|------------------------------------------|
| <code>outFile_</code> | Name of the configuration file to create |
|-----------------------|------------------------------------------|

4.5.3 Field Documentation

4.5.3.1 `bool InputParameters::debug`

Enables or disables the production of control plots for several kinematic quantities in this process

4.5.3.2 `double InputParameters::maxmx`

Maximal mass of the outgoing proton remnants, M_X , in GeV/c^2 .

4.5.3.3 `double InputParameters::maxpt`

Maximal transverse momentum cut to apply on the outgoing lepton(s)

4.5.3.4 `int InputParameters::mcut`

Set of cuts to apply on the outgoing leptons in order to restrain the available kinematic phase space :

- 0 - No cuts at all (for the total cross section)
- 1 - Vermaserens' hypothetical detector cuts : for both leptons,
 - $\frac{|p_z|}{|p|} \leq 0.75$ and $p_T \geq 1 \text{ GeV}/c$, or

– $0.75 < \frac{|p_z|}{|\mathbf{p}|} \leq 0.95$ and $p_z > 1 \text{ GeV}/c$,

- 2 - Cuts on both the outgoing leptons, according to the provided cuts parameters
- 3 - Cuts on at least one outgoing lepton, according to the provided cut parameters

4.5.3.5 double InputParameters::minmx

Minimal mass of the outgoing proton remnants, M_X , in GeV/c^2 .

4.5.3.6 double InputParameters::minpt

Minimal transverse momentum cut to apply on the outgoing lepton(s)

4.5.3.7 int InputParameters::ntreat

Note

Is it correctly implemented ?

4.5.3.8 int InputParameters::p1mod

The first incoming particle type and kind of interaction :

- 1 - electron,
- 2 - proton elastic,
- 3 - proton inelastic without parton treatment,
- 4 - proton inelastic in parton model

Note

Was named PMOD in ILPAIR

4.5.3.9 int InputParameters::p2mod

Note

Was named EMOD in ILPAIR

4.5.3.10 int InputParameters::pair

The particle code of produced leptons, as defined by the PDG convention :

- 11 - for e^+e^- pairs
- 13 - for $\mu^+\mu^-$ pairs
- 15 - for $\tau^+\tau^-$ pairs

4.5.3.11 bool InputParameters::symmetrise

List of Gnuplot objects which can be used to produce control plots all along the cross-section determination and events generation process

Note

Maximum number of these can be raised in the [utils.h](#) file, but pay attention to the memory load since these Gnuplot objects are still under development!

The documentation for this class was generated from the following file:

- include/utils.h

4.6 MCGen Class Reference

Core of the Monte-Carlo generator.

Public Member Functions

- [MCGen](#) ([InputParameters](#) ip_)
- Class constructor.*
- void [ComputeXsection](#) (double *, double *)
- [InputParameters](#) [GetInputParameters](#) ()
- Returns the set of parameters used to setup the phase space to integrate.*

4.6.1 Detailed Description

This object represents the core of this Monte Carlo generator, with its allowance to generate the events (using the embedded [Vegas](#) object) and to study the phase space in term of the variation of resulting cross section while scanning the various parameters (point **x** in the DIM-dimensional phase space).

The phase space is constrained using the [InputParameters](#) object given as an argument to the constructor, and the differential cross-sections for each value of the array **x** are computed in the f-function defined outside (but populated inside) this object.

This f-function embeds a [GamGam](#) object which defines all the methods to obtain this differential cross-section as well as the in- and outgoing kinematics associated to each particle.

Author

Laurent Forthomme laurent.forthomme@uclouvain.be

Date

February 2013

4.6.2 Constructor & Destructor Documentation

4.6.2.1 MCGen::MCGen ([InputParameters](#) ip_)

Sets the number of dimensions on which to perform the integration, according to the set of input parameters given as an argument and propagated to the whole object

Parameters

| | |
|------------|---------------------------------------------------------------------------------------|
| <i>ip_</i> | List of input parameters defining the phase space on which to perform the integration |
|------------|---------------------------------------------------------------------------------------|

4.6.3 Member Function Documentation

4.6.3.1 void MCGen::ComputeXsection (double *, double *)

Computes the cross-section for the run defined by this object. This returns the cross-section as well as the absolute error computed along.

4.6.3.2 [InputParameters](#) MCGen::GetInputParameters () [inline]

Returns

The InputParameter object embedded in this class

The documentation for this class was generated from the following file:

- `include/mcgen.h`

4.7 Particle Class Reference

Kinematics of one particle.

Inheritance diagram for Particle:

Public Member Functions

- `void AddDaughter (Particle *part_)`
Specify a decay product for this particle.
- `Particle * GetDaughter (const unsigned int num_=0)`
Gets a daughter from this particle, labelled by its identifier in this particle's daughters list.
- `std::string GetLHEline (bool revert_=false)`
- `Particle * GetMother ()`
Gets the mother particle from which this particle arises.
- `double M2 ()`
Gets the particle's squared mass.
- `unsigned int NumDaughters ()`
Gets the number of daughter particles arising from this one.
- `void SetE (double E_)`
Sets the particle's energy.
- `void SetMother (Particle *part_)`
Sets the mother particle (from which this particle arises)
- `bool SetP (double px_, double py_, double pz_)`
Sets the 3-momentum associated to the particle.
- `bool SetP (double px_, double py_, double pz_, double E_)`
Sets the 4-momentum associated to the particle.
- `bool SetP (double p_[3], double E_)`
Sets the 4-momentum associated to the particle.

Data Fields

- `double e`
Energy, in GeV.
- `double eta`
Pseudo-rapidity.

- bool `isValid`
Is this particle a valid particle which can be used for kinematic computations ?
- double `m`
Mass in GeV/c^2 .
- double `p`
Norm of the 3-momentum, in GeV/c .
- int `pdgId`
Particle Data Group integer identifier.
- double `pt`
Transverse momentum, in GeV/c .
- double `px`
Momentum along the x-axis in GeV/c .
- double `py`
Momentum along the y-axis in GeV/c .
- double `pz`
Momentum along the z-axis in GeV/c .
- int `role`
Role in the considered process.
- int `status`
Particle status.

4.7.1 Detailed Description

Kinematic information for one particle

4.7.2 Member Function Documentation

4.7.2.1 void Particle::AddDaughter (Particle * *part_*)

Parameters

| | |
|--------------|-----------------------------------------------------------------------------------------|
| <i>part_</i> | The Particle object in which this particle will desintegrate or convert |
|--------------|-----------------------------------------------------------------------------------------|

4.7.2.2 Particle* Particle::GetDaughter (const unsigned int *num_* = 0)

Returns

A [Particle](#) object containing all the kinematic information related to this daughter particle

4.7.2.3 std::string Particle::GetLHEline (bool *revert_* = false)

Returns a string containing all the particle's kinematics as expressed in the Les Houches format

Parameters

| | |
|----------------|-------------------------------------------------------------------------------------------|
| <i>revert_</i> | Is the event symmetric ? If set to true, the third component of the momentum is reverted. |
|----------------|-------------------------------------------------------------------------------------------|

Returns

The LHE line associated to the particle, and containing the particle's history (mother/daughters), its kinematics, and its status

4.7.2.4 void Particle::SetE (double *E_*) [inline]

Parameters

| | |
|----------|----------------|
| $E_{_}$ | Energy, in GeV |
|----------|----------------|

4.7.2.5 void Particle::SetMother (Particle * *part_*) [inline]

Parameters

| | |
|--------------|-----------------------------------------------------------------------------------------|
| <i>part_</i> | A Particle object containing all the information on the mother particle |
|--------------|-----------------------------------------------------------------------------------------|

4.7.2.6 bool Particle::SetP (double *px_*, double *py_*, double *pz_*) [inline]

Parameters

| | |
|------------|---------------------------------------------|
| <i>px_</i> | Momentum along the <i>x</i> -axis, in GeV/c |
| <i>py_</i> | Momentum along the <i>y</i> -axis, in GeV/c |
| <i>pz_</i> | Momentum along the <i>z</i> -axis, in GeV/c |

4.7.2.7 bool Particle::SetP (double *px_*, double *py_*, double *pz_*, double *E_*) [inline]

Sets the 4-momentum associated to the particle, and computes its (invariant) mass.

Parameters

| | |
|------------|---------------------------------------------|
| <i>px_</i> | Momentum along the <i>x</i> -axis, in GeV/c |
| <i>py_</i> | Momentum along the <i>y</i> -axis, in GeV/c |
| <i>pz_</i> | Momentum along the <i>z</i> -axis, in GeV/c |
| <i>E_</i> | Energy, in GeV |

Here is the call graph for this function:

4.7.2.8 bool Particle::SetP (double *p_[3]*, double *E_*)

Parameters

| | |
|-----------|----------------|
| <i>p_</i> | 3-momentum |
| <i>E_</i> | Energy, in GeV |

4.7.3 Field Documentation

4.7.3.1 int Particle::status

Codes 1-10 correspond to currently existing partons/particles, and larger codes contain partons/particles which no longer exist, or other kinds of event information

The documentation for this class was generated from the following file:

- `include/particle.h`

4.8 Vegas Class Reference

[Vegas](#) Monte-Carlo integrator instance.

Public Member Functions

- [Vegas](#) (int dim_, double f_(double *, size_t, void *), [InputParameters](#) *inParam_)
- [~Vegas](#) ()
Class destructor.
- int [Integrate](#) (double *result_, double *abserr_)
Launches the integration of the provided function.
- int [LaunchGeneration](#) ()
Launches the generation of events.

4.8.1 Constructor & Destructor Documentation

4.8.1.1 [Vegas::Vegas](#) (int dim_, double f_double *, size_t, void *, [InputParameters](#) * inParam_)

Constructs the class by booking the memory and structures for the GSL [Vegas](#) integrator. This code from the GNU scientific library is based on the [Vegas](#) Monte Carlo integration algorithm developed by P. Lepage. [1]

Parameters

| | |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>dim_</i> | The number of dimensions on which the function will be integrated |
| <i>f_</i> | The function one is required to integrate |
| <i>inParam_</i> | A list of parameters to define the phase space on which this integration is performed (embedded in an InputParameters object) |

4.8.2 Member Function Documentation

4.8.2.1 int [Vegas::Integrate](#) (double * result_, double * abserr_)

Launches the [Vegas](#) integration of the provided function with the provided input parameters.

Parameters

| | |
|----------------|-------------------------------------------------------------------------------------------------|
| <i>result_</i> | The cross section as integrated by Vegas for the given phase space restrictions |
| <i>abserr_</i> | The error associated to the computed cross section |

4.8.2.2 int [Vegas::LaunchGeneration](#) ()

Launches the [Vegas](#) generation of events according to the provided input parameters.

The documentation for this class was generated from the following file:

- `include/vegas.h`
