Contents

1 Principles

This Monte Carlo generator, based on the LPAIR code developed in the early 1990s by J. Vermaseren *et al*[3], allows to compute the cross-section and to generate events for the $\gamma\gamma \to \ell^+\ell^-$ process in high energy physics.

The main operation is the integration of the matrix element (given as a GamGam object, subset of a Process object) performed by *Vegas*, an importance sampling algorithm written in 1972 by G. P. Lepage[2].

2 Todo List

Global GamGam::ComputeWeight (int nm_=1)

Find out what this *nm_* parameter does...

Global GamGam::GamGam (const unsigned int ndim_, int nOpt_, double x_[])

Figure out how this *nOpt_* parameter is affecting the final cross-section computation and events generation

3 Deprecated List

Global MCGen::LaunchGeneration ()

This method is to be suppressed since the events generation can now be launched one event at a time using the *GenerateOneEvent* method

4 Hierarchical Index

4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Event   **2**

GamGamKinematics   **12**

Hadroniser   **14**

5 Data Structure Index

5.1 Data Structures

Here are the data structures with brief descriptions:

6 Data Structure Documentation

6.1 Event Class Reference

Kinematic information on the particles in the event.

Public Member Functions

- int AddParticle (Particle ∗part_, bool replace_=false)

  Add a particle to the event.
- void Dump (bool stable_=false)
- Particle ∗ GetById (int id_)

  Gets one particle by its unique identifier in the event.
- Particles GetByIds (std::vector< int > ids_)

  Gets a vector of particles by their unique identifier in the event.
- Particles GetByRole (int role_)

  Copies all the relevant quantities from one Event object to another.
- Particles GetDaughters (Particle ∗part_)

  Gets a vector containing all the daughters from a particle.
- std::string GetLHERecord (const double weight_=1.)

  Gets the LHE block for this event.
- Particle ∗ GetMother (Particle ∗part_)
- Particle ∗ GetOneByRole (int role_)
- Particles GetParticles ()

  Gets a vector of particles in the event.
- std::vector< int > GetRoles ()
- Particles GetStableParticles ()

  Gets a vector of stable particles in the event.
- int NumParticles ()

  Number of particles in the event.
- void Store (std::ofstream ∗, double weight_=1.)

6.1.1   Detailed Description

Class containing all the information on the in- and outgoing particles' kinematics

6.1.2   Member Function Documentation

6.1.2.1   int Event::AddParticle (**Particle** ∗ part_, bool replace_ = `false`)

Sets the information on one particle in the process

Parameters

in	part_	The Particle object to insert or modify in the event
in	replace_	Do we replace the particle if already present in the event or do we append another particle with the same role ?

Returns

- 1 if a new Particle object has been inserted in the event
- 0 if an existing Particle object has been modified
- -1 if the requested role to edit is undefined or incorrect

6.1.2.2   void Event::Dump (bool stable_ = `false`)

Dumps all the known information on every Particle object contained in this Event container in the output stream

Parameters

in	stable_	Do we only show the stable particles in this event ?

6.1.2.3 **Particle**∗ Event::GetById (int id_)

Returns the pointer to the Particle object corresponding to a unique identifier in the event

Parameters

in	id_	The unique identifier to this particle in the event

Returns

A pointer to the requested Particle object

6.1.2.4 Particles Event::GetByIds (std::vector< int > ids_) [inline]

Returns the pointers to the Particle objects corresponding to the unique identifiers in the event

Parameters

in	ids_	The unique identifiers to the particles to be selected in the event

Returns

A vector of pointers to the requested Particle objects

6.1.2.5 Particles Event::GetByRole (int role_)

Returns the list of pointers to the Particle objects corresponding to a certain role in the process kinematics Gets a list of particles by their role in the event

Parameters

in	role_	The role the particles have to play in the process

Returns

A vector of pointers to the requested Particle objects

### 6.1.2.6 Particles Event::GetDaughters (**Particle** ∗ part_) [inline]

Parameters

in	part_	The particle for which the daughter particles have to be retrieved

Returns

A Particle objects vector containing all the daughters' kinematic information

Here is the call graph for this function:

6.1.2.7 std::string Event::GetLHERecord (const double weight_ = 1.)

Returns an event block in a LHE format (a XML-style) with all the information on the particles composing this event

Parameters

in	weight_	The weight of the event

Returns

A string containing the kinematic quantities for each of the particles in the event, formatted as the LHE standard requires.

6.1.2.8 Particle∗ Event::GetMother (Particle ∗ part_) [inline]

Returns the pointer to the mother particle of any given Particle object in this event

Parameters

in	part_	The pointer to the Particle object from which we want to extract the mother particle

Returns

A pointer to the mother Particle object

Here is the call graph for this function:
6.1.2.9   **Particle**∗ Event::GetOneByRole (int role_)   [inline]

Returns the first Particle object in the particles list whose role corresponds to the given argument

6.1.2.9   **Particle**∗ Event::GetOneByRole (int role_)   [inline]

Parameters

in	role_	The role the particle has to play in the event

Returns

A Particle object corresponding to the first particle found in this event

Here is the call graph for this function:

```
┌─────────────────────┐        ┌─────────────────────┐
│ Event::GetOneByRole │───────▶│  Event::GetByRole   │
└─────────────────────┘        └─────────────────────┘
```

6.1.2.10 Particles Event::GetParticles (   )

Returns

A vector containing all the pointers to the Particle objects contained in the event

6.1.2.11 std::vector<int> Event::GetRoles (   )

Gets a list of roles for the given event (really process-dependant for the central system)

Returns

A vector of integers corresponding to all the roles the particles can play in the event

6.1.2.12 Particles Event::GetStableParticles (   )

Returns

A vector containing all the pointers to the stable Particle objects contained in the event

6.1.2.13 int Event::NumParticles (   ) [inline]

Returns

The number of particles in the event, as an integer

6.1.2.14 void Event::Store (std::ofstream ∗, double weight_ = 1.)

Stores in a file (raw format) all the kinematics on the outgoing leptons

Parameters

in	weight_	The weight of the event

## 6.2 GamGam Class Reference

Computes the matrix element for a $\gamma\gamma \to \ell^+\ell^-$ process.

Inheritance diagram for GamGam:

Collaboration diagram for GamGam:

Public Member Functions

- GamGam (const unsigned int ndim_, int nOpt_, double x_[])

  Class constructor.
- void ComputeCMenergy ()

  Computes $\sqrt{s}$ for the system.
- double ComputeMX (double x_, double outmass_, double ∗dw_)

  Computes the ougoing proton remnant mass.
- double ComputeWeight ()

  Returns the weight for this point in the phase-space.
- double ComputeWeight (int nm_=1)

  Computes the process' weight for the given point.
- void FillKinematics (bool symmetrise_=false)

  Fills the Event object with the particles' kinematics.
- double **GetD3** ()
- Event ∗ GetEvent ()

  Returns the event content (list of particles with an assigned role)
- double **GetS1** ()
- double **GetS2** ()
- double GetT1 ()
- void GetT1extrema (double &t1min_, double &t1max_)

- double GetT2 ()
- void GetT2extrema (double &t2min_, double &t2max_)
- double **GetU1** ()
- double **GetU2** ()
- double **GetV1** ()
- double **GetV2** ()
- bool IsKinematicsDefined ()

  Is the system's kinematics well defined?
- void PrepareHadronisation (Particle *part_)
- bool SetIncomingKinematics (Particle ip1_, Particle ip2_)

  Sets the momentum and PDG id for the incoming particles.
- void SetKinematics (GamGamKinematics cuts_)

  Sets the list of kinematic cuts to apply on the outgoing particles' final state.
- bool SetOutgoingParticles (int part_, int pdgId_)

  Sets the PDG id for the outgoing particles.
- void **StoreEvent** (std::ofstream *, double)

6.2.1 Detailed Description

Full class of methods and objects to compute the full analytic matrix element [3] for the $\gamma\gamma \to \ell^+\ell^-$ process according to a set of kinematic constraints provided for the incoming and outgoing particles (the GamGam-Kinematics object).

6.2.2 Constructor & Destructor Documentation

6.2.2.1 GamGam::GamGam (const unsigned int ndim_, int nOpt_, double x_[])

Sets the mandatory parameters used in the methods computing the kinematics and the cross-section of this phase space point.

Parameters

in	*ndim_*	The number of dimensions of the point in the phase space
in	*nOpt_*	Optimisation???
in	*x_[]*	The (*ndim_*)-dimensional point in the phase space on which the kinematics and the cross-section are computed

Todo Figure out how this *nOpt_* parameter is affecting the final cross-section computation and events generation

6.2.3 Member Function Documentation

6.2.3.1 void GamGam::ComputeCMenergy ( )

Computes the centre of mass energy for the system, according to the incoming particles' kinematics

6.2.3.2 double GamGam::ComputeMX (double x_, double outmass_, double * dw_)

Computes the mass of the outgoing proton remnant if any

Parameters

in	x_	A random number (between 0 and 1)
in	outmass_	The maximal outgoing particles' invariant mass
out	dw_	The size of the integration bin

Returns

    The mass of the outgoing proton remnant

6.2.3.3 double GamGam::ComputeWeight (int nm_ = 1)

Computes the cross-section for the $\gamma\gamma \to \ell^+\ell^-$ process with the given kinematics

Parameters

in	nm_	???

Returns

    $\frac{\mathrm{d}\sigma}{\mathrm{d}\mathbf{x}}(\gamma\gamma \to \ell^+\ell^-)$, the differential cross-section for the given point in the phase space.

Todo Find out what this nm_ parameter does...

6.2.3.4 void GamGam::FillKinematics (bool symmetrise_ = false)

Fills the private Event object with all the Particle object contained in this event. The particle roles in this process are defined as following :

Figure 1: Detailed particle roles in the two-photon process as defined by the *GamGam* object. The incoming protons/electrons are denoted by a role 1, and 2, as the outgoing protons/protons remnants/electrons carry the indices 3 and 5. The two outgoing leptons have the roles 6 and 7, while the lepton/antilepton distinction is done randomly (thus, the arrow convention is irrelevant here).

Parameters

in	symmetrise_	Do we have to symmetrise the event (randomise the production of the positively- and negatively-charged lepton) ?

6.2.3.5 **Event**∗ GamGam::GetEvent ( ) [inline]

Returns the complete list of Particle with their role in the process for the point considered in the phase space as an Event object.

Returns

    The Event object containing all the generated Particle objects

6.2.3.6   double GamGam::GetT1 (   ) `[inline]`

Returns the value for the first photon virtuality

Returns

t_1, the first photon virtuality

6.2.3.7   void GamGam::GetT1extrema (double & t1min_, double & t1max_) `[inline]`

Returns the two limit values for the first photon virtuality

Parameters

out	t1min_	The minimal value for t_1
out	t1max_	The maximal value for t_1

6.2.3.8   double GamGam::GetT2 (   ) `[inline]`

Returns the value for the second photon virtuality

Returns

t_2, the second photon virtuality

6.2.3.9   void GamGam::GetT2extrema (double & t2min_, double & t2max_) `[inline]`

Returns the two limit values for the second photon virtuality

Parameters

out	t2min_	The minimal value for t_2
out	t2max_	The maximal value for t_2

6.2.3.10   bool GamGam::IsKinematicsDefined (   ) `[inline]`

Is the system's kinematics well defined and compatible with the process ? This check is mandatory to perform the (_ndim)-dimensional point's cross-section computation.

Returns

A boolean stating if the input kinematics and the final states are well defined

6.2.3.11   void GamGam::PrepareHadronisation (**Particle** ∗ part_)

Sets all the kinematic variables for the outgoing proton remnants in order to be able to hadronise them afterwards

Parameters

in	part_	Particle to "prepare" for the hadronisation to be performed

6.2.3.12   bool GamGam::SetIncomingKinematics (**Particle** ip1_, **Particle** ip2_)

Specifies the incoming particles' kinematics as well as their properties using two Particle objects.

Parameters

in	*ip1_*	Information on the first incoming particle
in	*ip2_*	Information on the second incoming particle

Returns

A boolean stating whether or not the incoming kinematics is properly set for this event

6.2.3.13 void GamGam::SetKinematics (**GamGamKinematics** cuts_)

Parameters

in	*cuts_*	The Cuts object containing the kinematic parameters

6.2.3.14 bool GamGam::SetOutgoingParticles (int part_, int pdgId_)

Parameters

| in	*part_*	Role of the particle in the process
in	*pdgId_*	Particle ID according to the PDG convention

Returns

A boolean stating whether or not the outgoing kinematics is properly set for this event

6.3 GamGamKinematics Class Reference

List of kinematic cuts to apply on the central and outgoing phase space.

Collaboration diagram for GamGamKinematics:

Public Member Functions

- void Dump ()

    Dumps all the parameters used in this process cross-section computation / events generation.

Data Fields

- double emax

    Maximal energy of the central two-photons system.

- double emin

    Minimal energy of the central two-photons system.

- int kinematics

    Type of kinematics to consider for the phase space.

- int mode

    Sets of cuts to apply on the final phase space.

- double mxmax

    Maximal mass (in GeV/c ^{2}) of the outgoing proton remnant(s)

- double mxmin

    Minimal mass (in GeV/c ^{2}) of the outgoing proton remnant(s)

- double ptmax

    Maximal transverse momentum of the single outgoing leptons.

- double ptmin

    Minimal transverse momentum of the single outgoing leptons.

- double q2max

    The maximal value of Q^2.

- double q2min

    The minimal value of Q^2.

- double thetamax

    Maximal polar ($\theta_{\max}$) angle of the outgoing leptons, expressed in degrees.

- double thetamin

    Minimal polar ($\theta_{\min}$) angle of the outgoing leptons, expressed in degrees.

- double wmax

    The maximal s on which the cross section is integrated. If negative, the maximal energy available to the system (hence, $s = (\sqrt{s})^2$) is provided.

- double wmin

    The minimal s on which the cross section is integrated.
6.3.1   Field Documentation

6.3.1.1   int GamGamKinematics::kinematics

Type of kinematics to consider for the process. Can either be :
- 0 for the electron-electron elastic case

- 1 for the proton-proton elastic case

- 2 for the proton-proton single-dissociative (or inelastic) case

- 3 for the proton-proton double-dissociative case

6.4 Hadroniser Class Reference

Inheritance diagram for Hadroniser:

                    └──────────────┘
```

Public Member Functions

- std::vector< Particle > GetHadrons ()
- virtual bool Hadronise (Particle *part_)

  Main caller to hadronise a particle.

- virtual bool Hadronise (Event *ev_)

  Hadronises a full event.

Protected Attributes

- std::vector< Particle > * _hadrons

  List of hadrons produced by this hadronisation process.

- std::string _name

  Name of the hadroniser.

6.4.1 Detailed Description

Class template to define any hadroniser as a general object with defined methods

Author

Laurent Forthomme laurent.forthomme@uclouvain.be

Date

January 2014

6.4.2   Member Function Documentation

6.4.2.1   std::vector<**Particle**> Hadroniser::GetHadrons (   )   `[inline]`

Gets the full list of hadrons (as Particle objects) produced by the hadronisation

Returns

A vector of Particle containing all the hadrons produced

6.4.2.2   virtual bool Hadroniser::Hadronise (**Event** ∗ ev_)   `[inline]`, `[virtual]`

Launches the hadroniser on the full event information

Parameters

in,out		ev_	The event to hadronise

Returns

A boolean stating whether or not the hadronisation occured successfully

Reimplemented in Pythia6Hadroniser, and Jetset7Hadroniser.

Here is the call graph for this function:
6.5   Jetset7Hadroniser Class Reference

Jetset7 hadronisation algorithm.

Inheritance diagram for Jetset7Hadroniser:
Collaboration diagram for Jetset7Hadroniser:

Public Member Functions

- std::vector< Particle > GetHadrons ()
- bool Hadronise (Particle *part_)

    Main caller to hadronise a particle.

- bool Hadronise (Event *ev_)

    Hadronises a full event.

Protected Attributes

- std::vector< Particle > * _hadrons

    List of hadrons produced by this hadronisation process.

- std::string _name

    Name of the hadroniser.

6.5.1   Member Function Documentation

6.5.1.1   std::vector<**Particle**> Hadroniser::GetHadrons (   ) `[inline], [inherited]`

Gets the full list of hadrons (as Particle objects) produced by the hadronisation

Returns

A vector of Particle containing all the hadrons produced

6.5.1.2   bool Jetset7Hadroniser::Hadronise (**Event** ∗ ev_) `[virtual]`

Launches the hadroniser on the full event information

Parameters

in,out	ev_	The event to hadronise

Returns

A boolean stating whether or not the hadronisation occured successfully

Reimplemented from Hadroniser.

6.6   MCGen Class Reference

Core of the Monte-Carlo generator.

Public Member Functions

- MCGen (Parameters ∗ip_)

    Class constructor.
- void **AnalyzePhaseSpace** (const std::string)
- void ComputeXsection (double ∗xsec_, double ∗err_)

    Compute the cross-section for the given process.
- Event ∗ GenerateOneEvent ()
- Parameters GetParameters ()

    Returns the set of parameters used to setup the phase space to integrate.
- void LaunchGeneration ()
- void **Test** ()

6.6.1   Detailed Description

This object represents the core of this Monte Carlo generator, with its allowance to generate the events (using the embedded Vegas object) and to study the phase space in term of the variation of resulting cross section while scanning the various parameters (point **x** in the DIM-dimensional phase space).

The phase space is constrained using the InputParameters object given as an argument to the constructor, and the differential cross-sections for each value of the array **x** are computed in the f-function defined outside (but populated inside) this object.

This f-function embeds a GamGam object which defines all the methods to obtain this differential cross-section as well as the in- and outgoing kinematics associated to each particle.

Author

Laurent Forthomme `laurent.forthomme@uclouvain.be`

Date

February 2013

6.6.2 Constructor & Destructor Documentation

6.6.2.1 MCGen::MCGen (**Parameters** ∗ ip_)

Sets the number of dimensions on which to perform the integration, according to the set of input parameters given as an argument and propagated to the whole object

Parameters

in	ip_	List of input parameters defining the phase space on which to perform the integration

6.6.3 Member Function Documentation

6.6.3.1 void MCGen::ComputeXsection (double ∗ xsec_, double ∗ err_)

Computes the cross-section for the run defined by this object. This returns the cross-section as well as the absolute error computed along.

Parameters

out	xsec_	The computed cross-section, in pb
out	err_	The absolute integration error on the computed cross-section, in pb

6.6.3.2 **Event**∗ MCGen::GenerateOneEvent ( )

Generates one single event given the phase space computed by Vegas in the integration step

Returns

A pointer to the Event object generated in this run

6.6.3.3 **Parameters** MCGen::GetParameters ( ) `[inline]`

Returns

The Parameter object embedded in this class
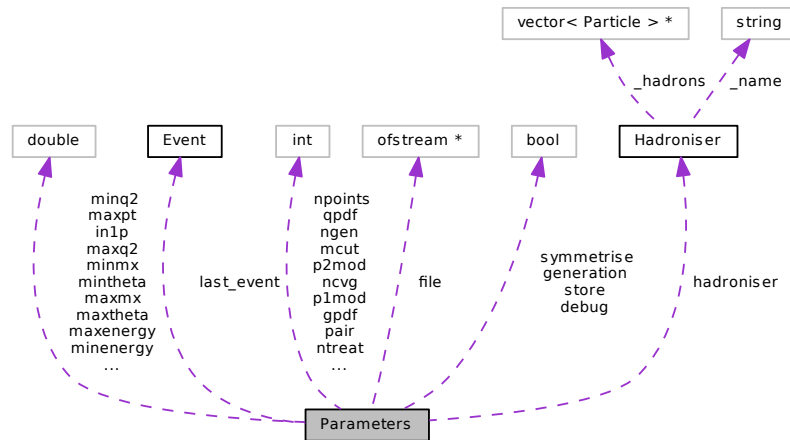

6.6.3.4 void MCGen::LaunchGeneration ( )

Launches the full events generation

Deprecated This method is to be suppressed since the events generation can now be launched one event at a time using the *GenerateOneEvent* method

6.7 Parameters Class Reference

List of parameters used to start and run the simulation job.

Collaboration diagram for Parameters:

Public Member Functions

- void Dump ()

  Dumps the input parameters in the console.
- bool ReadConfigFile (std::string inFile_)

  Reads content from config file to load the variables.
- void SetEtaRange (double etamin_, double etamax_)

  Sets the pseudo-rapidity range for the produced leptons.
- bool StoreConfigFile (std::string outFile_)

  Stores the full run configuration to an external config file.

Data Fields

- bool debug

  Do we need control plots all along the process?
- std::ofstream ∗ file

  The file in which to store the events generation's output.
- bool generation

  Are we generating events ? (true) or are we only computing the cross-section ? (false)
- int gpdf

  PDFLIB group to use.
- Hadroniser ∗ hadroniser

  Hadronisation algorithm to use for the proton(s) remnants fragmentation.
- double in1p

  First incoming particle's momentum (in GeV/c)
- double in2p

  Second incoming particle's momentum (in GeV/c)
- int itvg

  Maximal number of iterations to perform by VEGAS.
- Event ∗ last_event

  The pointer to the last event produced in this run.

- double maxenergy

  Maximal energy of the outgoing leptons.

- int maxgen

  Maximal number of events to generate in this run.

- double maxmx

  Maximal M_X of the outgoing proton remnants.

- double maxpt

  Maximal p_T of the outgoing leptons.

- double maxq2

  Maximal value of Q^2, the internal photons lines' virtuality.

- double maxtheta

  Maximal polar angle θ of the outgoing leptons.

- int mcut

  Set of cuts to apply on the outgoing leptons.

- double minenergy

  Minimal energy of the outgoing leptons.

- double minmx

  Minimal M_X of the outgoing proton remnants.

- double minpt

  Minimal p_T of the outgoing leptons.

- double minq2

  Minimal value of Q^2, the internal photons lines' virtuality.

- double mintheta

  Minimal polar angle θ of the outgoing leptons.

- int **ncvg**
- int ngen

  Number of events already generated in this run.

- int npoints

  Number of points to "shoot" in each integration bin by the algorithm.

- int ntreat

  Maximal number of TREAT calls.

- int p1mod

  First particle's mode.

- int p2mod

  Second particle's mode.

- int pair

  PDG id of the outgoing leptons.

- int qpdf

  Number of quarks.

- int spdf

  PDFLIB set to use.

- bool store

  Are the events generated in this run to be stored in the output file ?

- bool symmetrise

  Control plots objects.

6.7.1 Detailed Description

Note

The default parameters are derived from GMUINI in LPAIR

6.7.2   Member Function Documentation

6.7.2.1   bool Parameters::ReadConfigFile (std::string inFile_)

Reads the list of parameters to be used in this cross-section computation/events generation from an external input card.

Parameters

in	*inFile_*	Name of the configuration file to load

Returns

A boolean stating whether this input configuration file is correct or not

6.7.2.2 void Parameters::SetEtaRange (double etamin_, double etamax_)

Defines the range to cover in pseudo-rapidity for the outgoing leptons produced in this process. This method converts this range into a range in θ, the polar angle.

Parameters

in	*etamin_*	The minimal value of η for the outgoing leptons
in	*etamax_*	The maximal value of η for the outgoing leptons

6.7.2.3 bool Parameters::StoreConfigFile (std::string outFile_)

Parameters

in	*outFile_*	Name of the configuration file to create

Returns

A boolean stating whether this output configuration file is correctly written or not

6.7.3 Field Documentation

6.7.3.1 bool Parameters::debug

Enables or disables the production of control plots for several kinematic quantities in this process

6.7.3.2 double Parameters::maxmx

Maximal mass of the outgoing proton remnants, M_X, in GeV/c ^{2}.

6.7.3.3 double Parameters::maxpt

Maximal transverse momentum cut to apply on the outgoing lepton(s)

6.7.3.4 int Parameters::mcut

Set of cuts to apply on the outgoing leptons in order to restrain the available kinematic phase space :

- 0 - No cuts at all (for the total cross section)
- 1 - Vermaserens' hypothetical detector cuts : for both leptons,
    - $\frac{|p_z|}{|\mathbf{P}|} \leq 0.75$ and $p_T \geq 1$ GeV/c, or
    - $0.75 < \frac{|p_z|}{|\mathbf{P}|} \leq 0.95$ and $p_z > 1$ GeV/c,
- 2 - Cuts on both the outgoing leptons, according to the provided cuts parameters
- 3 - Cuts on at least one outgoing lepton, according to the provided cut parameters

6.7.3.5 double Parameters::minmx

Minimal mass of the outgoing proton remnants, M_X, in GeV/c ^{2}.

6.7.3.6   double Parameters::minpt

Minimal transverse momentum cut to apply on the outgoing lepton(s)

6.7.3.7   int Parameters::ntreat

Note

Is it correctly implemented ?

6.7.3.8   int Parameters::p1mod

The first incoming particle type and kind of interaction :

- 1 - electron,

- 2 - proton elastic,

- 3 - proton inelastic without parton treatment,

- 4 - proton inelastic in parton model

    Note

    Was named PMOD in ILPAIR

6.7.3.9   int Parameters::p2mod

Note

Was named EMOD in ILPAIR

6.7.3.10   int Parameters::pair

The particle code of produced leptons, as defined by the PDG convention :

- 11 - for e^+e^- pairs

- 13 - for $\mu^+\mu^-$ pairs

- 15 - for $\tau^+\tau^-$ pairs

6.7.3.11   bool Parameters::symmetrise

List of Gnuplot objects which can be used to produce control plots all along the cross-section determination and events generation process

Note

Maximum number of these can be raised in the utils.h file, but pay attention to the memory load since these Gnuplot objects are still under development!

6.8   Particle Class Reference

Kinematics of one particle.

Collaboration diagram for Particle:
Public Member Functions

- Particle (int role_, int pdgId_=0)

  Object constructor (providing the role of the particle in the process, and its Particle Data Group identifier)
- bool AddDaughter (Particle ∗part_)

  Specify a decay product for this particle.
- void Dump ()

  Dumps all the information on this particle.
- void E (double E_)

  Sets the particle's energy.
- double E ()

  Gets the particle's energy.
- double Eta ()

  Pseudo-rapidity.
- std::vector< int > GetDaughters ()

  Gets a vector containing all the daughters unique identifiers from this particle.
- std::string GetLHEline (bool revert_=false)
- int GetMother ()

  Gets the unique identifier to the mother particle from which this particle arises.
- bool Hadronise (std::string algo_)

  Hadronises the particle using Pythia.
- double M ()

  Gets the particle's mass.
- bool M (double m_)

  Set the particle's mass in GeV/c ^{2}.
- double M2 ()

  Gets the particle's squared mass.
- unsigned int NumDaughters ()

  Gets the number of daughter particles arising from this one.
- bool operator< (const Particle &rhs)

  Comparison operator to enable the sorting of particles in an event according to their unique identifier.
- Particle & operator= (const Particle &)

  Copies all the relevant quantities from one Particle object to another.

- bool P (double px_, double py_, double pz_)

  Sets the 3-momentum associated to the particle.
- bool P (double px_, double py_, double pz_, double E_)

  Sets the 4-momentum associated to the particle.
- bool P (double p_[3], double E_)

  Sets the 4-momentum associated to the particle.
- bool P (double p_[4])

  Sets the 4-momentum associated to the particle.
- double P ()

  Norm of the 3-momentum, in GeV/c.
- double ∗ P3 ()

  Returns the particle's 3-momentum.
- double ∗ P4 ()

  Returns the particle's 4-momentum.
- void **PDF2PDG** ()
- double **Phi** ()
- bool Primary ()

  Is this particle a primary particle ?
- double Pt ()

  Transverse momentum, in GeV/c.
- double Rapidity ()

  Rapidity.
- void SetMother (Particle ∗part_)

  Sets the mother particle (from which this particle arises)
- bool Valid ()

  Is this particle a valid particle which can be used for kinematic computations ?

Data Fields

- float charge

  The particle's electric charge (given as a float number, for the quarks and bound states)
- int id

  Unique identifier of the particle (in a Event object context)
- std::string name

  Particle's name in a human-readable format.
- int pdgId

  Particle Data Group integer identifier.
- double px

  Momentum along the x-axis in GeV/c.
- double py

  Momentum along the y-axis in GeV/c.
- double pz

  Momentum along the z-axis in GeV/c.
- int role

  Role in the considered process.
- int status

  Particle status.

6.8.1 Detailed Description

Kinematic information for one particle

6.8.2   Member Function Documentation

6.8.2.1   bool Particle::AddDaughter (**Particle** ∗ part_)

Adds a "daughter" to this particle (one of its decay product(s))

Parameters

in	part_	The Particle object in which this particle will desintegrate or convert

Returns

A boolean stating if the particle has been added to the daughters list or if it was already present before

6.8.2.2   void Particle::Dump ( )

Dumps into the standard output stream all the available information on this particle

6.8.2.3   void Particle::E (double E_) `[inline]`

Parameters

in	E_	Energy, in GeV

6.8.2.4   double Particle::Eta ( ) `[inline]`

Computes and returns η, the pseudo-rapidity of the particle

Returns

The pseudo-rapidity of the particle

Here is the call graph for this function:
6.8.2.5   std::vector<int> Particle::GetDaughters ( )

Returns

An integer vector containing all the daughters' unique identifier in the event

6.8.2.6   std::string Particle::GetLHEline (bool revert_ = `false`)

Returns a string containing all the particle's kinematics as expressed in the Les Houches format

Parameters

in	revert_	Is the event symmetric ? If set to true, the third component of the momentum is reverted.

Returns

The LHE line associated to the particle, and containing the particle's history (mother/daughters), its kinematics, and its status

6.8.2.7   int Particle::GetMother (   )   `[inline]`

Returns

An integer representing the unique identifier to the mother of this particle in the event

6.8.2.8   bool Particle::Hadronise (std::string algo_)

Hadronises the particle with Pythia, and builds the shower (list of Particle objects) embedded in this object

Parameters

in	algo_	Algorithm in use to hadronise the particle

6.8.2.9   double Particle::M (   )   `[inline]`

Gets the particle's mass in GeV/c ^{2}.

Returns

The particle's mass

6.8.2.10   bool Particle::P (double px_, double py_, double pz_)   `[inline]`

Parameters

in	px_	Momentum along the x-axis, in GeV/c
in	py_	Momentum along the y-axis, in GeV/c
in	pz_	Momentum along the z-axis, in GeV/c

Returns

A boolean stating the validity of this particle (according to its 4-momentum norm)

Here is the call graph for this function:
6.8.2.11   bool Particle::P (double px_, double py_, double pz_, double E_)   `[inline]`

Sets the 4-momentum associated to the particle, and computes its (invariant) mass.

Parameters

in	px_	Momentum along the x-axis, in GeV/c
in	py_	Momentum along the y-axis, in GeV/c
in	pz_	Momentum along the z-axis, in GeV/c
in	E_	Energy, in GeV

Returns

A boolean stating the validity of the particle's kinematics

Here is the call graph for this function:
6.8.2.12 bool Particle::P (double p_[3], double E_)

Parameters

in	p_	3-momentum
in	E_	Energy, in GeV

Returns

A boolean stating the validity of the particle's kinematics

6.8.2.13 bool Particle::P (double p_[4]) `[inline]`

Parameters

in	p_	4-momentum

Returns

> A boolean stating the validity of the particle's kinematics

Here is the call graph for this function:

```
┌──────────────┐     ┌──────────────┐     ┌──────────────┐
│  Particle::P │ ──► │  Particle::P │ ──► │ Particle::Pt │
└──────────────┘     └──────────────┘     └──────────────┘
```
6.8.2.14   double Particle::P (   ) `[inline]`

Returns

> The particle's 3-momentum norm as a double precision float

Here is the call graph for this function:

```
┌──────────────┐     ┌──────────────┐
│  Particle::P │ ──► │ Particle::Pt │
└──────────────┘     └──────────────┘
```

6.8.2.15   double* Particle::P3 (   ) `[inline]`

Returns

> The particle's 3-momentum as a 3 components double array

6.8.2.16   double* Particle::P4 (   ) `[inline]`

Builds and returns the particle's 4-momentum as an array ordered as $(\mathbf{p}, E) = (p_x, p_y, p_z, E)$

Returns

> The particle's 4-momentum as a 4 components double array

Here is the call graph for this function:

```
┌───────────────┐     ┌──────────────┐
│  Particle::P4 │ ──► │  Particle::E │
└───────────────┘     └──────────────┘
```

6.8.2.17   double Particle::Rapidity (   ) `[inline]`

Computes and returns y, the rapidity of the particle

Returns

   The rapidity of the particle

Here is the call graph for this function:

6.8.2.18   void Particle::SetMother (**Particle** $*$ part_)

Sets the "mother" of this particle (particle from which this particle is issued)

Parameters

in	*part_*	A Particle object containing all the information on the mother particle

6.8.3   Field Documentation

6.8.3.1   int Particle::pdgId

Unique identifier for a particle type. From [1] : *The Monte Carlo particle numbering scheme [...] is intended to facilitate interfacing between event generators, detector simulators, and analysis packages used in particle physics.*

6.8.3.2   int Particle::status

Codes 1-10 correspond to currently existing partons/particles, and larger codes contain partons/particles which no longer exist, or other kinds of event information

6.9   Process Class Reference

Inheritance diagram for Process:
Public Member Functions

- double ComputeWeight ()

  Returns the weight for this point in the phase-space.

6.9.1 Detailed Description

Class template to define any process to compute using this MC integrator/generator

Author

Laurent Forthomme laurent.forthomme@uclouvain.be

Date

January 2014

6.10 Pythia6Hadroniser Class Reference

Pythia6 hadronisation algorithm.

Inheritance diagram for Pythia6Hadroniser:
Collaboration diagram for Pythia6Hadroniser:
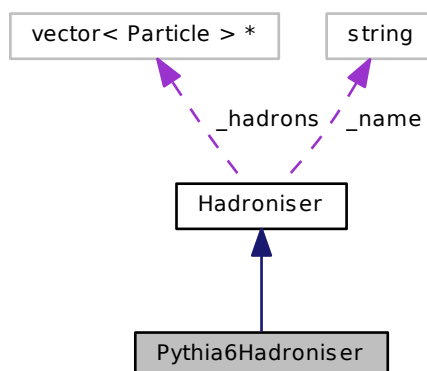

Public Member Functions

- std::vector< Particle > GetHadrons ()
- bool Hadronise (Particle ∗part_)

  Main caller to hadronise a particle.
- bool Hadronise (Event ∗ev_)

  Hadronises a full event.

Protected Attributes

- std::vector< Particle > ∗ _hadrons

  List of hadrons produced by this hadronisation process.
- std::string _name

  Name of the hadroniser.

6.10.1 Member Function Documentation

6.10.1.1 std::vector<**Particle**> Hadroniser::GetHadrons ( ) `[inline]`, `[inherited]`

Gets the full list of hadrons (as Particle objects) produced by the hadronisation

Returns

A vector of Particle containing all the hadrons produced

6.10.1.2 bool Pythia6Hadroniser::Hadronise (**Event** ∗ ev_) `[virtual]`

Launches the hadroniser on the full event information

Parameters

in,out	ev_	The event to hadronise

Returns

A boolean stating whether or not the hadronisation occured successfully

Reimplemented from Hadroniser.

6.11 Vegas Class Reference

Vegas Monte-Carlo integrator instance.

Public Member Functions

- Vegas (const int dim_, double f_(double ∗, size_t, void ∗), Parameters ∗inParam_)
- ∼Vegas ()

  Class destructor.
- void Generate ()

  Launches the generation of events.
- bool GenerateOneEvent ()

  Generates one single event according to the method defined in the Fortran 77 version of LPAIR.
- int Integrate (double ∗result_, double ∗abserr_)

6.11.1 Detailed Description

Main occurence of the Monte-Carlo integrator[2] developed by G.P. Lepage in 1978

6.11.2 Constructor & Destructor Documentation

6.11.2.1 Vegas::Vegas (const int dim_, double f_double *, size_t, void *, **Parameters** * inParam_)

Constructs the class by booking the memory and structures for the Vegas integrator. This code is based on the Vegas Monte Carlo integration algorithm developed by P. Lepage, as documented in [2]

Parameters

in	dim_	The number of dimensions on which the function will be integrated
in	f_	The function one is required to integrate
in,out	inParam_	A list of parameters to define the phase space on which this integration is performed (embedded in an Parameters object)

6.11.3 Member Function Documentation

6.11.3.1 void Vegas::Generate ( )

Launches the Vegas generation of events according to the provided input parameters.

6.11.3.2 bool Vegas::GenerateOneEvent ( )

Generates one event according to the grid parameters set in Vegas::SetGen

Returns

A boolean stating if the generation was successful (in term of the computed weight for the phase space point)

6.11.3.3 int Vegas::Integrate (double * result_, double * abserr_)

Vegas algorithm to perform the (_dim)-dimensional Monte Carlo integration of a given function as described in [2]

Author

Primary author : G.P. Lepage
This C++ implementation : L. Forthomme

Date

September 1976
Reviewed in Apr 1978
FTN5 version 21 Aug 1984
This C++ implementation is from 12 Dec 2013

Parameters

out	result_	The cross section as integrated by Vegas for the given phase space restrictions

out	*abserr_*	The error associated to the computed cross section

Returns

    0 if the integration was performed successfully
